 ders perception more atcurate. Repetition alone gives lat!ing impreffon, and thas lates the foundation of mebons: for fingle impreflions are but retained for a thort time, and are for 11 forgot. 'Thus a perfon, who at prefent has htite knowtedre of cloths, will, by fretpently handing them, acquirc a fkill of difcerning them, which to others feens almolt impolible. Many are apt to millake this for a nicer femibility, but they are much mikaken; for it is an unverfal law, that the repetition of impreffon renders us lefs aconte. This is well illuftrated by the operation of medicines; for all medicines which act on the organs of fente mult, after fome time, be increafed in their dofe to produce the fame effects as at lirt. 'This affords a rule in practice with regard to thefe medicines; it beconing neceffary, after a certain time, to change one medicine even for a weaker of the fame nature. 'lhus medicines, which even have no great apparent force, are found, by long ufe, to deftroy the fenlibility of the fyetem to other impreifions. But to this general rule, that, by repetition, the force of impreflions is more and more diminifhed, there are fome exceptions. Chus perfons, by a ttrong emetic, have had their ftomachs rendered fo irritable, that $1-20$ h of the firit dole was fufficient to produce the fame effect. This, however, oftener takes place when the vomit is repeated every day; for if the fame vomit be given at pretty contiderable intervals, the geneial rule is obferved to hold good. Thus two contrary effects of habit are to be noted; and it is proper to obferve, that the greater irritability is more readily produced when the firt impreffion is grat, as in the cafe firlt given of the itrong emetic. This may be farther illuftrated hy the effect of fear, Which is commonly obferved to be diminithed on repetition: which can only be attributed to cuftom: while, on the other hand, there are inltances of perfons, who, having once got a great fight, have for ever after continued flaves to tears excited by impreflions of the like kind, hewever flight; which mut be imputed en. tisely to eycefs of the hirit impreftion, as las been already obfersed. To this head alfo belongs the affociatuon of ideas, which is the foundation of memory and all onr intellectual faculties, and is entirely the fffert of cufom; with regard to the body alfo, thefe affociatinns often take place. And fometimes, fin prodacing effecs on the body, affociations feemingly opfite are formed, which, through cuftom, beconee ahfo. lutely neceftry; s.g. a perfor limg accuftomed to neep in the meighbourhood of a great noife, is fo far from being incommoded on that account, that afterevesds fuch noife becomes neceffary tu procuce ilecp.

It will be of ufe to attend to this in medical practice; for we ought to allow for, however oppofite it n7y feem at the time, whatever ufually attended $t^{i}$ purpofe we defign to effect. 'I'hus, in the infance of fleep, we mull not exclude moife when we want to procure reft, or any canfes which may fecm uppofite to fuch an effect, provided cuthom has rendered then neceltary.
3. Effeds on the Moving Fibres. A ecrtain degree of tention is necedfary tomotion, which is to be deter nined by cultom; e.g. a fencer, accultomed to one foil, camot have the fame fteadinefs or activity with one heavier or lighter. It is neceffary alfo that every morion fhonld be performed in the fame fituation, or poiture of the hody, as the perfon has been accuitomed to cmploy in that motion. Thus, in any chirurgical operation, a certain polture is recommended; but if the operator has been accultomed to another, fuch a one, however ankward, becomes neceffary afterwards to his righe performance of that operation.

Cuftom alfo determines the degree of ofcillation of which the moving libres are capable. A perfon aceuftomed to Atrong mufcular exertions is quite incapable of the more delicate. Thus writing is performed by fmall mufcular contractions; but if a perfon has been. accultomed to frouger motions with thefe mufoles, he will write with much lefs Iteadinefs.

This fubject of tenfion, fosmerly attributed to the fimple fibres, is probably more Atrictly applicable to the moviug: for, befides a tention from flexion, there is alfo a tenfion from irritation and fympathy ; e. f. the tenfion of the flomach from food, gives tenfion to the whole body. Wine and fpiritnous liquors give tenfion; e. $g$. a perfon that is fo affected with tremor as farcely to hold a glafs of any of thefe liquors to his head, has no fooner fwallowed it, than his whole body becomes fteady; and after the fyftem has been accuftomed to fuch fimuli, if they are not applied at the ufual time, the whole body becomes flaccid, and of confequence unleady in its motions.

Again, cuftom gives facility of motion. This fcems. to proceed from the diftention which the nervous power gives to the moving fibres themfelves. But in whatever manner it is occafioned, the effect is obvious; for any new or unufual motion is performed with great difficulty.

It is fuppoled that fenfation depends on a communication with the fenforimm commune, by means of organs fufficiently diftended with nervous influence. We have found, that fenfibility is diminithed by repetition. And we have now to obferve, that in fome cafes it may be incraled by repetition, owing to the nervous. power itfelf fowing more eafily into the part on account of cuftom. Attention to a particular olject may alfo determine a greater influx into any particular part, and thus the fentibility and irritability of that particular part may be increafed.

But with regard to facility of motion, the nervous power, no doubt, flows molt eafly into thofe parts to which it has been accuftomed: yet facility of motion does not entirely depend on this, but in part allo on the encurrence of the action of a great many mufcles; e. $g$. Winllow has obferved, that in performing any motion, a number of mufeles concur to give dixed puitat to thofe iniensed chiefly to act, as well as to

Cimnng
an: 172b

## G U S [622]

Eufin others that are to vary and modify their action. This, and luhit. however, is affifted by repetition and the freer influx; as by experience we know the proper attitude for giving a fixed point in order to perform any action with facility and Ateadinefs.

Cuthom gives a fontaneous motion alfo, which feems to recur at ftated periods, even when the exciting caufes are removed. Thus, if the fomach has been accultomed to vomit from a particular medicine, it will require a much fmaller dofe than at firf, may, even the very fight or remembrance of it will be fufficient to produce the effect ; and there are not wanting in. fances of habitual romiting, from the injudicious adminiftration of emetics. It is on this account that all jpafmodic affections fo eaflly bccome habitual, and are fo difficult of cure; as we mult not only avoid all the exciting caufes, even in the fmalleft degree, but alfo their afociations.

Cuftom alfo gives ftrength of motion; ftrength de pends on ftrong ofcillations, a free and copious influx of the nervous power, and on denfe folids. But in what manner all thefe circumstances have been brought about by repetition, has been already explained. The effect of cuftom, in producing ftrength, may be thus ilutrated: a man that begins with lifting a calf, by continuing the fame practice every day, will be able to lift it when grown to the full fize of a bull.

All this is of confiderable importance in the pratice of phyfic, though but too little regarded; for the recovery of weak people, in great mearure, depends on the ufe of exercife, fuited to their ftrength, or rather within it, frequently repeated and gradnally increafed. Farther, it is neceflary to obferve, that cuftom regulates the particular celerity with which each motion is to be performed : for a perfon accuftomed, for a confiderable time, to one degree of celerity, becomes incapable of a greater ; e. g. a man accuftomed to now walking will be out of breath before he can run 20 paces. The train, or order, in which our motions are to be performed, is alfo eftablifhed by cuttom; for if a man hath repeated motions, for a certain time, in any particular order, he cannot afterwards perform them in any other. Cuftom alfo very frequently aflociates motions and fenfations: thus, if a perfon has been in ufe of affociating certain ideas with the ordinary fimulus which in health excites urine, without thefe ideas the ufual inclination will farce excite that excretion; and, when thefe occur, will require it even in the abfence of the primary exciting caufe: e. g. it is very ordinary for a perfon to make urine when going to bed; and if he has been, for any length of time, accultomed to do fo, he will ever afterwards make urine at that time, though otherwife he would often have no fuch inclination: by this means fome fecretions become, in a manner, fubject to the will. The fame may be faid of going to ftool: and this affords us a good rule in the cafe of cotivenels; for by en. deavouring to fis a Itated time for this evacuation, it will afterwads, at fuch time, more readily return. It is farther remarkable, that motions are infeparably affociated with other motions: this, perhaps, very often proceeds from the neceffary degree of tenfion; but it alfo often depends merely on cuftom, an inftance of which we have in the uniform motions of our eyes.
4. Effecs on the whole Nerwous Power. We have
found, that, by cuftom, the nervous influence may be determined more eafily into one part than another; and therefore, as all the parts of the fyfern are ftrongly connected, the fenfibility, irritability, and itrength of any particular part, may be thus increaled. Cuftom alfo has the power of altering the natural temperament, and of inducing a new one. It is alfo in the power of cuitom to render motions periodical, and periodically fpontaneous. An inftance of this we have in Reep, which is commonly faid to be owing to the nervous power being exhaufted, the neceffary confequence of which is Aleep, e.g. a reft of the voluntary motions to favour the recruit of that power: but if
 ferent times, according as the caufes which diminifa the nervous influence operate more or lefs powerfully; whereas the cale is quite otherwife, thefe returns of fleep being quite regular. This is no lefs remarkable in the appetites, that return at particular periods, independent of every caule but cultom. Hunger, 8.g. is an extremely uneafy fenfation; but goes off of itfelf, if the perfon did not take food at the ufual time. The excretions are farther proofs of this, e. g. going to atool, which, if it depended on any particular irritation, fhould be at longer or fhorter intervals according to the nature of the aliment. There are many other inftances of this difpofition of the nervous influence to periodical mocions, as the Itory of the idiot of Stafford, recorded by Dr Plot (Spectator, $n^{\circ}$ 447.), who, being accuftomed to tell the hours of the churchclock as it fruck, told them as exactly when it did not Arike by is being out of order. Montaigne tells us of fome oxen that were employed in a machine for drawing water, who, after making 300 turns, which was the ufual number, could be ftimulated by no whip or goad to proceed farther. Infants, alfo, cry for and expect the breaft at thofe times in which the nurfe has been accultomed to give it.

Hence it would appear, that the human economy is fubject to periodical revolutions, and that thefe happen not oftener may be imputed to varicty : and this feems to be the reafon why they happen oftener in the body than mind, becaufe that is cubject to greater variety. We fee frequent inflances of this in difeafes, and in their crifes; intermitting fevers, epileplies, atlhmas, \&ce. are examples of periodical affections: and that critical days are not fo ftrongly marked in this country as in Greece, and fome others, may be imputed to the variety and inftability of our climate; but perhaps fill more to the lefs fenfibility and irritability of our fyltem ; for the exhibition of medicine has little effect in difturbing the crifes, though it be commonly affigned as a caufe.

We are likewife fubject to many habits independent of ourfelves, as from the revolutions of the celeftial bodies, particularly the fun, which determines the body, perhaps, to other daily revolutions befides fleeping and waking. There are alfo certain habits depending on the feafons. Our connections, likewife, with refpect to mankind, are means of inducing habits. Thus regularity from aflociating in bufinefs, induces regular habits both of mind and body.

There are many difeafes which, though they arofe at firlt from particular caufes, at laft continue merely through cultom or habit. Thefe are chiepy of the

## C U S

cuftom nervons fyftem. We flould therefore itudy to counad Habit, Cufroms. teract fuch habits; and accordingly Hippocrates, anong other things for the cure of epilepry, orders an entine clange of the manner of life. We likewife imitate this in the chincough; which often refilts all remedies till the air, diet, and ordinary train of life, are changed.
5. Effeets on the Blood-veflels. From what has been faid on the nervous power, the diftribution of the fluids muft neceffarily be varioully affected by cuitom, and with that the difribution of the different excretions; for though we make an eftimate of the proportion of the excretions to one another, according to the climate and feafons, they mult certainly be very much varied by cuttom.

On this head we may obferve, that blood-letting has a manifeft tendency to increafe the quantity of the blood; and if this tyacuation be repeated at flated times, fuch fymptoms of repletion, and fuch motions are excited at the returning periods, as render the operation necelfary. The fame has been obferved in fome fpontaneous hemorrhagies. Thefe, indeed, at firft, may have fome exciting caufes, but afterwards they feem to depend chiefly on cuftom. The belt proof of this is with regard to the menftrual evacuation. There is certainly fomething originally in females, that determines that evacuation to the monthly periods. Confant repetition of this comes to fix it, independent of ftrong eaufes, either favouring or preventing repletion; e. g. blood-letting will not impede it, nor filling the body induce it : and indeed, to much is this evacuation connected with periodical mutions, that it is little in our power to produce any effect by medicines but at thofe particular times. Thus if we would relas the uterine fylem, and bring back this evacuation when fuppreffed, our attempts would be vain and fruitlefs, unlefs given at that time when the menfes thould have naturaliy returned.

CUSTOMS, in political economy, or the dutits, toll, tribute, or tariff, payable to the king upon merchandize exported and imported, form a branch of the perpetual taxes. See Tax.

The cenfiderations upon which this revenve (or the more ancient part of it, which arofe only from exports) was invefted in the king, were faid to te two: I. Becaufe he gave the fubject leave to depart the kingoom, and to carry his goods along with him. 2. Becanle the king was bound of common right to maintain and keep up the ports and bavens, and to proteat the merchant from pirates. Some have imagined they are ealled with us cufoms, becaufe they were the inheritance of the king by immemorial ufage and the common law, and not granted him by any tatute : but Sir Edward Coke hath clearly fhown, that the king's fift claim to them was by grant of parliament 3 Edw. I. though the record thereof is not now extant. And indeed this is in exprefs words confefed by fatute 25 Edw. I. c. 7. wherein the king promifes to take no cuftoms from merchants, without the common affent of the realn, "faving to us and our heirs the cuftoms on wool, fkins, and leather, formerly granted to us by the commonalty aforefaid." Thefe were formerly called hereditary cuffoms of the crown; and were due on the exportation only of the faid thrce commodities, and of none other: which were Ayled the fagle commodi-
ties of the kingdom, becauft they were ooliged to be Cubom, brought to thofe ports where the king's Itaple was cftablifhed, is order to be there firt rated, and then exported. They were denominated in the barbarous Latin of our ancient records, cufluma, (an appellation which feems to be derived from the Freneh word wat. Aum, or coitum, which fignitics toll or tribute, and owes its own etymology to the word conle, which hign:fies price, charge, or, as we have adopted it in Engtifh, cofl) ; not confuceludines, which is the languase of our law whenever it means merely ufages. Thi duties on wool, fheep- fkins or woolfells, and leather, exported, were called cuflunaz antigur five magna: and were payable by every merchant, as well native ab Atranger; with this difference, that merchant flangers paid an additional toll, viz. half as much again as was paid by natives. The cuffuma farya et novia were an impoth of 3 d. in the pound, due from merchane ftrangers only, for all commodities as well imported as ex. ported; which was ufually called the alien's duty, and was firt granted in 31 Edw. I. But thefe ancient hereditary cuftoms, efpecially thofe on wool and woolfolls, cante to be of little account, when the nation became fenfible of the advantages of a home manufacturt, and prohibited the exportation of wool by flatute 11 Edw. III. c. I.

Other culloms payable upon exports and imports were diltinguihned into fublidies, tonnage, poundage, and other impolts. Sublidies were fuch as were impoled by parliament upon any of the ttaple commodities before mentioned, over and above the cuftunc antiqua et magna: tonnage was a duty upon all wines imported, over and above the prifage and butlerage aforefaid: poundage was a duty impoled ad valorem, at the rate of 12 d . in the pound, on all other merchandize whatfoever: and the other impofts were fuch as were occafionally laid on by parliament, as circumflanees and times required. Thefe diftinctions are now in a manner forgotten, cxcept by the officers immediately concerned in this department; their produce being in effect all blended together, under the one denomination of the culons.

By thefe we underfland, at prefent, a duty ormatif. fubfidy paid by the merchant at the quay upon all Comamas imported as well as exported commodities, by authority of parliament; unfefs where, for particular national reafons, certain rewards, bounties, or drawbacks, aie allowed for particular exports or imports. The cuftoms thus impofed by pailiament are chiefly contained in two books of rates, fet forth by parliamentary authority ; one figned by Sir Harbottle Grimefton, fpeaker of the houfe of commons in Charles II.'s time; and the other an additional one figned by Sir Spenfer Compt on, fpeaker in the reign of George I. to which alfo fubfequent additions have been made. Aliens pay a larger proportion than natural fubjects, which is what is now generally underftood by the aliens duty; to be exempted from which is one principal caufe of the frequent applications to parliament for acts of naturalization.
Thefe cuftoms are then, we fee, a tax immediately paid by the merchant, although ultimately by the confumer. And $y$ et thefe are the duties felt leaft by the people: and, if prudently managed, the peopic hardly confider that they pay them at all. For the merchan:

Cuftoms - erchant is ealy, being feaftble he does not pay them It pre for himelf; and the confumer, who really pays Cufun Bre- them, confounds them with the price of the commovian. the emperor Nera gained the reputation of abolifhing the tax of the fale of haves, though he only transferred it from the buyer to the feller; fo that it was, as he exprefles it, remiffun mazis fecie, quam ri: quia, rom venditor pendere juberetur, in puritem pretii emptorithus narefeflut. But this inconvenience atterds it on the other hand, that thefe impolts, if too heary, are a check and cramp upon trade; and efpecialiy when the value of the commodity bears little or no proportion to the quantity of the duty impofed. This in confequence gives ife alfo to fmughting, which then becones a very lucrative employment: and its natural and molt reafonable punifhment, viz. confication of the commodisy, is in fuch cafes quite ineffectual; the intrinfic value of the goods, which is all that the fnugyler has paid, and therefore all that he can lofe, being very inconfiderable when compared with his profpect of advantage in evading the duty. Recourie anult therefore be had to extraordinary punifments to prevent it ; perhapseven to capital ones: which deAlroys all proportion of puaithment, and puts murderers upon an equal footing with fuch as are really guilty of no uatural, but merciy a politive, offence.
There is alfo auther ill confequence attending ligh impult 3 on merchandize, not frequently conifered, fout indifputably certain: that the carlier any tax is laid on a conmodity, the heavier it fallo upon the confumer in the end; for every trader through whofe hands it paffes mult have a profit, not onty epou the saw material and his own labour and time in prepasing it, but allo upon the very tax itfelf, which he advances to the govennment ; otherwife he lofes the wife and intereft of the money which be fo advances. To inflance in the article of foreign paper. The meachant pays a duty upon importation, which he does not receive again till he fells the commodity, perhaps at the end of three months. He is thercfore equally intitled ro a profit upon that duty which he pays at the cultomhoule, as to a profit upon the originat price which he pays to the manufacurer abroad; and confiders it accordingly in the price he demands of the liationer. When the flationer fells it again, he requires a profit of the printer or bookfeller upon the whole fum adranced by him to the merchants: and the bookfeller dees not ferget to chage the full proportion to the itudent or ultimate confumer; who therefore docan not only pay the original duty, but the profits of thele three intermediate traters, who have fueceffively adsanced it for him. This might be carried much farther in any mechanical, or more complicated, branch of trate.
Cistow-Honfe, an office eftablithed by the king's authority in the maritime cities, or port-towns, for the receint and management of the cuiloms and dutics of impostation and expurtation, impofed on merchandifes, and regulated by books of rates.

CUSTOS bREvicis, the principal clerk belonging to the court of common pleas, whofe butinefs it is to reccive and heep all the writs made returnable in that court, fling every return by iffle; and, at the end of each term, to receive of the prothonotaries all the accords of the nili prius, called the foldeas.
$\mathrm{N}^{\circ}{ }_{2}{ }^{6}$

Custos Rotulorum, an officer who has the cuitody Cufos Rom of the rolls and records of the feffions of peace, and d- tulorum fo of the commiffion of the peace itfelf.

He ufually is fome perfon of quality, and always a Enth. jultice of the peace, of the quorum, in the county where he is appointed.

Crsros Spivitualium, he that exercifes the firitual juridiction of a diocefe, during the vacancy of any fee, which, by the canon-law, belongs to the deans and chapter; but at prefent, in England, to the archbifhop of the province, by prefcription.

Cistos Tcmporalium, was the perfon to whom a vancant fee or abbey was given by the ling, as fupreme lord. His office was, as fteward of the goods and profite, to give an account to the effleator, who did the like to the exchequer.

CU'E-a-feather, it the fea-language. If a hip has too broad a bow, it is common to fay, flie weill nut cus a feathor, that is, the will not pafs through the water fo fwift as to make it foam or froth.

Cor Purfe, in law; if any perfor clam so fecrete, and without the knowledge of another, cut his purfe or pick his pucket, and fteal from thence above the value of twelve pence, it is felony excluded clergy.

Cui-turfes or factularii, were more feverely punifhed than conmon thieves by the Roman and Athenian laws.

Cut Water, the flarp part of the head of a fhip below the beak. It is fo called becaufe it cuts or divides the water before it comes to the bow, that it may not come too fuddenly to the breadth of the fluip, which would retard her.

CUTANEOUS, in general, an appellation given to whaterer belongs to the cutis or Rin. Thus, we fay cutanrous eruptions; the itch is a cutcmeous difeafe.

CUTH, ur Cuthah (anc. geog.), a protince of Affyria, which, as fome fay, lics upon the Araxes, and is the fame with Cull: but others take it to be the fame with the country which the Greeks call Syfuma, and which to this xery day, fays Dr Wells, is by the iabibitants called Chuffam. F. Calnct is of opinion that Cuthah and Sos thia are the fame place, and that the Cuthites who were removed into Samaria by Salmancer (2 Kings xvii. 24.) came from Cuh or Cuth, mentioned in Gen. ii. 13. See the article Cush. The Cuthite's worMipped the idol Nergal. id. ibid. 30. Thefe people were tranfulanted into Samaria in the room of the Ifactites, who hefore inhabited it. Calmet is of opinion, that they came from the land of Cuh, or Cuthah upon the Araxes; and that their firlt fettement was in the cities of the Medes, fubdued by Salmanefer and the kings of Syria his predeceffors. The feripture oblerves, that the Cuthites, upon their amival in this new country, continued to workip the gods formesly adored by them beyond the Euphrates. Efarkaddon. king of Affyria, who fucceeded Semacierib, appunted an ifraclitifl pricat to go thither, and inftruct them in the religion of the Hebrews. But thefe people thought they might reconcile thacir old fupertition with the worfhip of the true God. 'They therefore framed particular gods for themfelves, which they placed in the feveral cities whore they dwelt. The Cuthites then worthipped both the Lord and their falfe gods together, and chofe the loweft of the people to make 2
pricts

Cuticle priefls of them in the high places ; and they continaed this practice for a long time. But afterwards they forfook the wornip of idols, and adhered only to the law of Mofes, as the Samaritans who are defeended from the Cuthites do at this day.

CUTJCLE, the fearf-fkin. Sce Anatomy, $n^{3} 74$.
CUTICULAR, the fame with Cutanzous.
CU'l'S, the Rin. Sce Anatomy, no 76 .
CUTTER, a fmall veffel, commonly navigated in the channel of England. It is furnibhed with one matt, and rigged as a noop. Many of thefe veffels are ufed in an illicit trade, and others are cmployed by grovernment to take them ; the latter of which are either under the direction of the admiralty or cuftomhoure. See a reprefentation of a cutter of this fort in the plate referred to from the article Vessel.

Curter, is alfo a fmall boat ufed by mips of war.
Cittrak of the Tallies, an affece of the exchequer, whole butinefs is to provide wood for the tallies, to cut or notch the fum praid upon them; and then to calt them into court, to be writen upon. See Taley.

CUT'lJNG, a tom ufid in various fenfes and various ants; in the genctal, it implies a divifion or frparation.

Cutang is paticulanly ufed in heraldry, where the flield is divided into two equal parts, from right to left, parallel to the horizon, or in the lefe-way.

The word alfo is applied to the honourable ordinaries, and even to animaln and morcables, when they are divided equally the fame way; fo, however, as that one moiety is colour, the other metal. The ordinaries are faid to be cut, couped, when they do not come full to the extremities of the diteld.

Cutting, in chimurgery, denotes the operation of extracting the flone out of the bladder by fection. See Lithotomy.

Cutring in coinage. When the lamine or plates of the metal, he it gold, liker, or cepper, are brought to the thicknefs of the fpecies to he coined, pieces are cut out, of thicknefs, and ncanly of the weight, of the intended coin; which are now called plembets, till the king's image hath been famped on them. The inftrmant wherewith they cut, confifts of two pieces of fteel, very tharp, and placed over one another; the bower a little hollow, reprefenting a mortar, the other a petle. The metal put between the two, is cut out in the maner deforibed under connage.

Note. Medallions, where the relievo is to be great, are not cut, but call or moulded.

Cutting, in the manege, is when the horfe's feet interfere; or when with the fhoe of one foot he heats off the kin from the paltern joint of another foot. This is more frequent in the hind feet than the fore: the caufes ate either wearinefs, weaknels in the reins, not knowing how to go, or ill thoking.

Cutring, in painting, the laying one frong lively colour orer another, without any flade or fofteaing. The cutting of colours has always a difagrecable effect.

Cutting in urod, a particular kind of foupture or engraving: denominated from the matter wherein it is employed.

It is ufed for various purpofes; as for figured letters, head and tail-pieces of books; and even for focmes and other figures, to fare the expences of en-

Vol. V. Part IL.
graving on copper: and for prints and fampo for paper, callicoss, linens, de.

The invention of cutting in wood, as well as that in copper, is afrithed to a goddinuth of Forence; but it is to Albert Duser and Luras they are both in. debted for their perfection. Sce Engraving, and Printing.

One Hugo de Carpi invented a maner of eutting in wood, l,y means whereof the prinss alpeared as if painted in clair-obfoure. In order in this, he made three kinds of thamps for the fame defign; which were drawn, after one another, through the prefo for the fame print: they were fo conducted, as that one forred for the granel hights, a fecond for the demi-tents, and a third for the outlines and the deep nadows.

The art of cutting in wood was certainly carried to a very great pitch ahove two bundred years ago ; and might even vie, for beauty and jultnefs, with that of engraving in eepper. At prefent it is in a low condition, as having been long neglecked, and the application of artifts wholly cmployed on copper, as the more eafy and promiling province: net but that wooden cuts lave the advantaje of thofe in copper on many accounts: chielly for figures and devices in books; is being printed at the fame time and in the fane prels as the letters: whereas for the other, there is required a particular impreflion. In the reprefentation of plants and flowers, and in defigns for paper-lancings, where the ontline only is wanted to be printed, in a bold full manner, this method will be found cheapur and more effectual than the ufe of copper-plates.
'I'he cutters in wood begin with preparing a plath or bluck of the dize and thicknets required, and very even and fimeoth on the dide to be cut: for this, they ufually take bech, pear-tree, or box; though the latter is the bett, an being the clofet, and latt liable io be wom-cat. The wood being rut into a proper form and lize, foond be planced as coen and truly as poffible : it is then fit to reccive the draning or chabe ing of the defign to be engraved. But the effect may be made more apparent, and the ink, if any be uld in drawing, be preventad fom ruming, by lipeading thinly on the furface of the wood white lead temper ed with water, by grinding with a brufh pencil, and afterwards rubbing it well with a fine linen rage whilt it is wet ; and when it is dry, bruthing off any loofe or powdery part with a foft pencil.

On this block they draw their defign with a pen or pencil, juit as they would have it piented. Thofe who camot daw their own dedign, as there are many who cannot, make ufe of a defign fumithed them by another ; fatkning it upon the block with pathe made of Gour and water, with a hittle vincgar or gum tragacanth; the frokes or lines turned towards the wowl.

When the paper is dry, they wah it gently over with a fyonge dipped in water; which done, they take of the paper by little and little, ttill rubling it a little fird with the tip of the finger; till at length there be nothing left on the block but the Atrokes of ink that tom the delign, which mark out fo much of the block as is to be fared or left ltanding. Kigures are fometimes cut out of prints, by taking away all the white part or blank paper, and cemented with gum-water to the furface of the wood. 'Ihe rest they 4 K

# C U T $[626] \quad$ C U T 

Eutings cut off, and take away very curioully with the points Cutts. of very fharp knives, or little chiffels or gravers, according to the bignefs or delicacy of the work; for they need no other inftruments.

It difers from engraving in copper, bec:ufe in the Eicrmer, the imperfion comes from the prominent pasts or frokes left uncut; whereas in the latter, it comes from the chamels cut in the metal.
'Whe manner of printing with wooden prints is much more expeditious and eafy than thd of copuer-plate: becoure they require only to be dipt in the printingink, and impreficd on the object in the fame manner and with the fame apparatus as the letter-printing is managed; and for purpofes that do not require great correctnefs, the impreffon is made by the hand ouly, a proper handle being fixed to the middle of the print, by which it is tirlt dipped in the ink, fpread by means of a brufh on a block of proportionable fize covered with leather; and then lifted up infantly, and dropped with fome little force on the paper which is to reccive the impreflion.

Cutincs, or flips, in gardening, the branclues or Pprigs of tites or plants, cut or hlipped off to fet again; which is done in any moit finc earth.

The beit feafon is from Auruit to April; but care is to be taken when it is done, the fap be not too much in the top, len the cut die before that part in the carth have root enough to fupport it: nor yet malt it be too dry or feanty; the fap in the branches affing it to tase root.

In providing the cuttings, fuch branches as have joints, knots, or turre, are to be cut off iwo or three inches beneath them, and the liaves to be ftapped off fo far as they are fet in the earth. Small top-branches, of two or three years growth, are fitteit for this operation.

CUTMLE-fish. See Sepia. The bone of the cuttle-fifh is hard on one fide, but foft and yielding on the other; fo as readily to receive pretty neat impreffions from medals, \&sc. and afterwards to ferve as a mould for cating meials, which thus take the figure of the original: the bone is likewife frequently enfloyed for cleaning or poliming fiver. This inth contains in a certain diftinct veffel a fluid as black as ink: which it is faid to thed when purfued, and thus to conceal itfelf by difcolouring the water. The particular qualities of this liquor are not yet determined. Dr Leigh fays, he faw a letter which had been written with it ten years before, and which fill continued. Some report that the ancients made their ink from it; and others, that it is the bafis of China, or ludian-ink: but both thefe accounts appear to have little foundation. Pliry, fpeaking of the inks made ufe of in his time, after obferving that the cuttle-fifh is in this refpect of a wonderful nature, adds exprefsly, that irk was not made from it.

CUTTS (John lord), a foldier of molt hardy bravery in king William's wars, was fon of Richard Cutts, Efq; of Matching in Effex; where the family were fettled about the time of Heary VI. and had a great eftate. He entered early into the fervice of the duke of Monmouth, was aid-de-camp to the duke of loorain in Hungary, and lignalized himfelf in a very extraordinary manner at the taking of Buda by the Imperialifts in 1686 ; which important place had
$b$ een for near a century and a half in the hands of the Tarks. Mr Addifon, in a Latin puen wortby of the Aurnitan age, plainly hints at Mr Cutts's ditinguihed bravery at that fiege. Returning to England at the revolation, he had a regiment of foot; was created baron of Gowran in Ireland, Dec. 6. 1690 ; appointed rrovernar of the ille of Wight, Aprilit. 1693 ; was made a major-general; and, when the affalfaration project was difcovered, $1695 \cdot 6$, was captain of the king's ruard. In 1699 he was comptimented by Mr John Hoplines, as one to whum "a double cruwn was due," as a hero and a poet. He was coionel of the Coldlitam, or fecond regiment of eruards, in 1701; when Mr Stecle, who was indebed to his interelt for a military conmiffon, inferibed to him his firl work, " 'The Chinilian Hero." On the acceflion of queea Anne, he was made a lieutenant-general of the forces in Holland; commander in chicf of the forces in Ireland, under the dake of Oninuad, ifarch 23.1704.5; and afterwards one of the lords jultices of that kingdom, to keep him out of the wajo of action; a circumflance which broke his heart. He died at Dublia, $\mathrm{J}: \mathrm{n} .26$. $1706-\%$, and is buried there in the cathedral of Chrift cluorch. He wrote a poem on the death of queen Mary ; and publified, in 1887 , "Poetical exercifes, written upon feveral occafons, and dedicat d to luer royal Ifighees Mary piancels of Orange." It coutains, befules the dedication figned J. Cutts, verfes to that princefs; a poem on Wifdom; another to Mr Waller on his commending it; feven more copies of verfes (one of them called La Mruf Cavalier, which had been afcribed to lord Peterborough, and as fuci mentioned by Mir Walpole in the lift of that nobleman's writings), and in longs; the whole compofing but a very thin volume; which is by no means fo fearce as Mr Walpole fuppoles it to be. A fpecimen of his poctry (of which the five forlt lines are quoted by Stcele in his fifth Tather) is hore added:
Ony rell leer that I love,
lesue the reft in hor and Eate;
Sime hand phatet from ahave
Mas ferhaps!cepit; move;
Luvers on ther fter. maft wait
Only rell her thar I love.
Why, oh, why fo , uld I defpair?
Atersy's pintur'd in her eje:
If the onc-vouchiafe to hear,
Weconse hoje, ant we'com- fear.
She's two yood to let mie die;
Why, ch, why thould l derpui:?

CYATHUS, xuxtos (from the verb xusw, to poirr out), was a common meafure among the Greeks and Romans, both of the liquid and dry kind. It was equal to an ounce, or the twelfth part of a pint. The cyathus was made with an handle like our punch-ladle. The Roman topers were ufed to drink as many cyabio as there were mufes, i. e. uine; alfo as many as there were letters in the patron's name. Thus, they had modes of drinking himilar to the modern health-drinking or toalling. They fay, that the cyathus of the Greeks weighed 10 drachms; and Galen fays the fane; though elfewhere he fays, that a cyathus contains 12 drachms of oil, 13 drachms and one feruple of wine, water, or vinegar, and 18 drachms of honey. Galen fays, that among the Veterinarii the cyathus contained tivo ounces.

CYAXARES, fon of Phraortes, was king of Me-

## C F

 which the Scythims had invaded. He made war asaint Alyates hing of I.ydir: and Cubjered to his
power all Afia beyond the river Halys. He died aister a reign of 40 years, in the year of Rome 160.

Craxaras II. is fuppofed by fome to be the fame as Darius the Mede. He was fon of Altyayes king of Modia. He alded feren provinces to his father's dominions, and made war againft the Affrrians, whom Cyrus favoured.

CYBELE, a name of Cybele, from wuzustw, lecaufe in the celebration of her feftivals men were driven to madnefs.

ClBELEE, in Pagan mythology, the dauther of Coliss and Terra, and wife of Saturn. She is fuppofed to be the fame as Ceres, Rhea, Ops, Vend, Bona Mater, Magna Mater, Berecynthia, Dindynene, \&c. According to Dindorns, fle was the daug., ter of a Lydi a prince, and as foon as the was born fle was cuparal un a merentain. She was pereferved by fucking fome of the wild beatts of the foect, and rereived the name of Cybele from the mountain where her life had been preferved. When fee returued to hecr father's court, fle had an intrigue with $A$ tys, a beautiful youth whom her father matiated, \&cc. An the mythulogits are unanimons in mentioning the amones of Atys and Cybede. In Phrygia the fenlivals of Cybele were obferred with the greater folemnity. Her priefts, called Coryloner. Gulli, \&e. were not admitted in the fervice of the godders without a previous mutilation. In the colcbration of the foftivals, they imitated the manners of madmen, an f filled the air with thrieks and howlings mixed with the confufed uoife of drums, tabrets, buckicrs, and fpears. 'This was in commemeration of the forrow of Cybcic for the lofs of her favourite Atys. Cybele was generally reprefented as a roluft woman far advanced in her pregnancy, to intimate the fecundity of the earth. She held keys in leer hand, and her lead was crowned with rifing tursets, and fometimes with the leaves of an oak. She fometines appears riding in a chariot drawn by two :ume lions: Atys follows by frer fide, carrying a ball in his hand, and fupporting himfelf upon a fir tree which is facred to the goddefs. Sometimes fhe is reprefented with a foeptre in her hand, with her head cusered with a tover. She is alfo feen with many breats, to fiow that the earth gives aliments to all hiping creatures; and the generally carrics two lions under luer atms. From Pluygia the worthip of Cybele pafed into Greece, and was folemnly ellablifhed at Flewns noder the name of the LXeyinian mylteries of $C_{t}$ res. The Romans, by order of the Sibylline books, bronelt the fatue of the godiefs from Peffinus into Indy; and when the thip which carried it had run on a fhallow bank of the Tiber, the virtue and innocence of Clandia was vindicated in remoring it with her girdic. It is fuppofed that the myfteries of Cybele were firf known about 237 years before the Trojan war, or 1580 years before the Anguftan ace. The Romans were particularly fupertitions in withing every year, on the Gth of the kalends of April, the thrine of this goddefs in the waters of the riscr Almon. There prevailed many offenitics in the obfervation of the fellivals; and the priefls themfelves were the
mon enger to hice indecent expreffions, and to how their unboundel licentioufnefs by the impurity of their actions.
CYBELICUM mazmor, a nam givan by the ancients to a fpecies of marble dur in a mountain of that name in Parygia. It was of an extremely bright white, with brou veins of bluih black.
CYCAS, in botany: A gents of planta lvelonging to the firt uatural order. Padma. The fruit is a dry plum with a bivalved kerncl. There is but one fpecies defribed by Linneus, viz. the circinatix, or lagotree, which grows fontaneonlly in the Eat hidies, and partic larly on the coalt of Maldars. It runs up with a itraight trank to 40 feet or more, having many circles the whole length, oceafioned by the old leaves falling of ; for they flanding in a circalar order round the ftem, and embracing it with their bafe, whonever they drop, they leave the marks of their adticlion belind. The leaves are pinated, and grow to the length of feven or eight feet. The pinne or lobse are long, narrow, entire, of a fhining green, all the way of a breadth, lance-ihapet at the point, are clofely crouded togather, and land at right angles on cach fide the midrib, like the tecth of a comb. The flowers are produced in long bunches at the footfalks of the leaves, and are fucceeded by oval fruit, about the fize of large plans, of a red colour when ripa, and a fweet flavour. Each contains a hard bruwn nut, enclofing a white meat, which taftes like a chefuut.

This is a valuable tree to the inhabitants of India, as it not only furnilles a confiderablepart of their conftant bread, but alfo fupplies them with a large aricle of trade. The body contains a farinaceors fublance. which they extract from it and make into bread in this manner: they faw the body iuto finall pieces, and after leating them in a mortar, pour water upon the mafs; this is left for fome hours to feitic. When fit, it is frained through a cloth, and the fine particle, of the mealy fubitance running through with the water, the grofs ones are left behind and thrown away. After the farinaceous part is fuffiently fubfided, the water is poured off, and the meal being properly dried, is uceatomally made into cakes and baked. Thefe cakes are faid to eat nearly as well as wheaten bread, and are the fupport of the inhabitants for three or four months in the year.

The fame meal more finely pulverized, and reduced into granules, is what is called Sago, which is fent into all parts of Europe, and fold in the Rops for a great Atrengthener and reforative.

There is a fort of figo male in the Went Indies, and is fent to liurope in the fame manner as that from the Ealt ; but the Weft India fago is far inferior in quality to the other. It is fuppofed to be made from the pith of the areca oleracea. See Areca.
The brood boom (or breal-tree) of the Ifotentots, a plant latcly difcovered by profeflor Thumberg, is defcribed as a new fpscies of this genus, by the name of cyas Colfiga, in the Novia Aiga Reg. Soc. Sciant. The vol. ii. P. $283 . \mathrm{t}$ b. V. Tlie riti, or metall, which abounds in the trunk of this little palm, M, Sparman informs us, is collected and tied up in dreffed calf or fleep-flins, and then buried in the earth for the face of feveral weeks, till it becomes fufficiently: 4 K :

Cgoen anclluw and lender to be kaeaded up with water into Py, '2'3tra. a pate, of which they atterwards make finall loaves or cakes, and bake then untier the afhes. Other Hotinntuts, not quite fo nice, nor endued with patience enough to wait this tedious method of preparing it, are faid to dry and roatt the pith or marrow, and afterwards inake a kind of brown fumenty of $i t$.

CYCEON, from roxis:l", "to mix;" a mame given hy the ancient poets and phyficians to a mixture of meal and water, and fonctimes of other ingredients. Thefe conftuted the two kinds of cyccon; the counfer being of the water and meal alone; the richer and more delicate comprefe of wine, honey, flour, water, and cheefe. Horier, in the whe Had, talks of cycoon made with clatefe and the meal of bartey mised with wine hat withont any mention either of honey or water; and Ovid, defcribing the drathgt of eyecon given by the old woman of Athens to Ceres, mentions only flour and water. Diofoorides underftood the word in both thefe fenfes; but extolled it mott in the coarte and himple kind: he fays, when prepared with water alone, it tefrigerates and nourifhes ereatly.

ClCINNLS, a Grecian dance, fo called from the name of its inventor, one of the fatyrs belonging to 33 acchus. It contifted of a combination of grave and gray muvements.

CYCL.ADES insurae; iflands anciently fo callech, as illing informs us, from the Cyelus or orb in which ther lie; beginuing from the promontery Geraeftum of Enboea, and lying round the illand Delos, (Pliny).

Where incy are, and what their number, is not fo fremally "arecid. Strabo fiev, they were at firt zeckonel 12 , tut that many others were added: yet ment of chem lie to the fouth of lelos, and but few bo the north, fo that the midille or ceutre, aferibed to folos, it to be taken in a loofe, not a geometrical forfe. Sirabo recites them after Artemidnors, as folWows: Thelena, Ceos, Cynthus, Seriphus, Melus, Sifhes, Cimolus, Prepeffothus, Olearns, Naxus, Parus, Surns, lifeomus, T'enus, Andrus, Gyarus; but he exclice toon the number, Puepefinthus, Olcarus, and Gyaows.

CXCLAMEN, Sownerad: A genus of the monodryinorder, belorging to the pentandria clals of plants; und in the natural method ranking under the zolt orrier, Piecie. 'Ithe corolla is verticiliated, with the tube very nourt, and the throat prominent; the berry is covered wirh the capfule. There are bat two fpecies; which, however, proslace many luautiful varieties. Thiny are low, he baceots, flowery peremials of the tuberous rooted kind, with nomerous, angular, heartflaped, fpotted, markled leaves; with many flefhy font-lalks fix inches bigh, carrying monopetalous, fivc-parted reflexed fowers of various coloars. All the barities are extremely ormanental, and fome of the Aowers very fragrant. They may be planted in any of the common borders, bat require to be fheltered from hard fionts by being covered with mats. They foruld tho have a light diy foil, otherwife their roe ts are ayt to rot. The fpectes are proptrated by feeds, and the particular vaticies by dividing then ructs.

The ront of the cyclanen lras, when freth, an 6 x twemely acrimonims buming tate, which it lofes atmode entircly on being dried. It is recummended as
an erchine ; in cataplafms for feorrhous and cancerous tumors; and internally as a cathartic, detergent, and aperient. It operates very lowly, but with great virulence, inflaming the fances and inteftines.

CYCLE, in chronology, a certain period or feries of numbers, which regularly proceed from the firt to the lalt, and then retum again to the firl, and fo circulate perpetually. Sce Chronology, ne 26 .

Crcele of Indiction, a period of 15 years, in ufe among the Romans. It has no connection with the celeftial motion, but was inftituted, accordias to Baronius, by Conkantine; who having reduced the time which the Romans were obliged to ferve to 15 years, he was confequently obliged every is years to im. pofe, or Endiere according to the Latin expretion, an extraordinary tax for the payment of thofe who were difcratged; and hence arote this cyele, which. from the Latin word indicere, was Ityled indidion.

Cicle of the Aivor, called allo the golden ramber, and the Meionic cycle from its inventor Meton the Athenian, is a period of $\mathrm{I} y$ years, Which when they are completed, she new moons and full moons return on the lame days of the month, fo that on whatever days the new and full moons fall this year, ig years hence they will happen on the very fame days of the month, though not at the fame hour, as Meton and the ra. thers of the primitive church thought; and therefore, at the time of the council of Nice, when the method of finding the time for oblerving the fealt of Eatter was ellablished, the numbers of the lunar cycle were inferted in the kalendar, which, upon the account of their excellent ufe, were fet in goiden letters, and the year of the cycle called the gridon number of that year.

Cxcle of the Sun, a revolution of 23 years, which being elapled, the nlominical or Aianday-letters return to their former place, and procced in the fame order as before, according to the Julian kalendar.

CXCLISUS, in furgery, an intrument in the form of a half moon, ufed in feraping the floull, in cafe of fractures of that part.
$\mathrm{CXClOLD}^{\circ} \mathrm{OL}$, a curve on which the doctrine of pendulums, and time-meafuring infruments, in a great meafure depend; Mr Huygens demonitrated, that from whatever point or height a heavy body, ofcillating on a fixed centre, begins to defcend, while it continues to move in a cycloid, the time of its falls or ofcillations will be equal to each other. It is likewife demonftrable, that it is the curve of quickell defcent, i.e. a body falling in it, from any given point above, to another, not exactly under it, wall come to this point in a lefs time than in any other curve pafling througtr thofe two points.

CyCLOPAEDIA, or Encyciofeda, denotez the circle or compafs of arts and feiences. A cyclupedia, fay the anthors of the French Encyclopedie, ought to explain is much is poffle the order and connection of human knowledge.

CYCLOPS, in fabuloas hittory, the fons of Neptane and Amphitrite ; the principie of whom were Brontes Stcropes, and Peracmon; but their whole number amounted to above an huadred. Jupiter threw them into Tartarus as foon as ilncy were bown but they wers delivered at the interceflion of Tellus, and be-

## C Y C

Cyclopte- came the affifants of Vulcan. They were of prodigirus. ous itature, and had each only one eye, which was placed in the middle of their fureheads.

Sume mythologits fay, that the Cyclops fignify the vapours raifed in the air, which oceation thunder and lightning; on which account they are reprefented as froging the thunderbolts of Jupiter. Others reprefent them as the firlt inhabitants of Sicily, who were cruel, of a gigantic form, and dwelt round mount Ætna.

CYCLOPTERUS, the sUCKER, in ichthyology, a geaus belonging to the order of amphibia nantes. The head is obtule, and fimsifhed with faw-teeth: there are four rays in the gills; and the belly-tins are comected together in an onbicmar form. The fpecies are,
i. The lumpas, or lump-fith, grows to the length of If inches, and weighs feven pounds. The hape of the hody is like that of the brean, decp and very thick, and it fwims edge-ways. The back is iharp and elevated; the belly fat, of a bright crimfon colour. Arong the body there ran feveral rows of tharp bony thbercles, and the whole dian is covered with fmall oncs. The pectural fins are large and broad, alnout uniting at their baie. Bencath thefe is the part by which it adheres to the rocks, \&c. It confilits of an oval aperture, furrounded with a fefhy, mufular, and obtufe fuft fubtance; edged with many fmall threaded appendages, which concur as fo many claipers. 'The tail and went-fins are purple. By ineans of this part it adheres with valt forec to any thing it pleafes. As a proof of its tenacity, it hath been known, that in Hing. ing a fifn of this fpecies juft caught into a pat of warer, it fixed itfelf fo firmly to the buttom, that or taking the the by the tail, the whole pail by that means Was lifted, though it held fome galluns, without once raking the fifh quit its hold. Thefe tifh refort in minultitudes during fyming to the coall of Sutherland near the Ord of Caithnefs. The feals which fwarm beneath, prey greatly ulpon them, leaving the lkins; numbers of which, thus empticu, float ahhore at that featon. It is eafy to diftingnith the place where the feals are devouring this or any other unctuons tith, by a fimonthnefs of the water immediately above the foot. This fact is mow eltablifhed; it being a tried property of oil to thill the agitation of the waves aad render them froonth. Great numbers of lump-tinh are found in the Greenland feas during the months of Aprii and May, when they refort near the thore to fpawn. 'Tlueir roe is remarkably large, which the Grenlanders boil to a pulp and eat. They are extremely fat, which recommend; then the more to the natives, who admice all oily food. They cell them nhpifto or cat-fib, and take quantitics of them durimis the fation. The fill is funetimes eaten in kingland, being fewed like carp; but is buth thoby and inlipid.
2. The linaris take3 the name of for-frail from the foft and mictuous texture of its brely, refombling that of the lanl-fail. It is almont trampatent, and foun difineses and melts ansay. It is found in the fea near the meroths of great rivers, and hath becn feen full of fyann in Janary. The length is five inches; the culour a pale brwon, fonctimes findy ftreaked with a danker. Beatath the thoat is a round depretion of
a whitith colour like the imprefion of a feal, furounded by twelve fimall pale yellow tubera, by which probably it adheres to the Itomes like the other fpecies.
3. The leffer fucking-fin is fomd in different parts
 the thurse thonld the the ir comtinuance them; anduad the contrary, the harifer. itumbturer, and harder they ase, the harger the? thould tett.
'thete heap thonice be nexde in an even and oper part of an oochand, whthout any regard to covering from raina, dews, or what elfe may happen duning the apples itaying there; and whether they be carried in and broke in we: or dry weather, the thing is all the fam. Lf it maty be objected that during theit haning

 dit
lain tozether in the leap, they mas bave imibibed great humidity, as well from the air a's from the gromed, rain, dews, \&c. which are mixed with their jnices; the anfwer is, this will have no other effect than a kindly diluting, natual to the fruit, by which means a fecalier fermentation enfues, and all heterogeneons humid particles are thrown off.

The apples are then ground, and the punmice is reccivel in a large open-mouthed velfel, capable of containing as much thereof as is fufficient for one making, or one cheefe. Though it has been a cullom to let the pummice remain font hours in the vefflappropriated to contain it, yet that practice is by no means commendalle: for it the fruits did not come ripe from the trees, or otherwife matured, the pummice, remaininge in the vat too long, will acquire fuch harfonefs and coarfenefs from the flims as is hever to be got rid of; and if the pummice is of well ripened fruit, the continuing too long there will necation it to contract a flarpnefs that very often is followed with want of fipirit and pricking; nay, fometimes it even becomes vinegar, or always continues of a wheyif colour; all which proceeds from the beat of fermentation that it almolt inflantly falls into on lying together: the pummice thercfore fhould remain no longer in the vat than until there may be enough broke for one preflings, or that all be made into a cheefe, and preffed the bame day it is broken.

In Plate CLIV. is a perfeêtive view of the cyderprefs and apple-mill.
$A, B$, the buttom or lower beam ; C, D, the upper heam ; $5,6,7,8,9$, the uprights; 4, , e, e fours; $Z, 2,12$, braces, or crofs-pieces; $a, b$, capitals; $X$, blocks; $s$, the ferew; E, the hack or receiver; E, the cheefe or cake of $p$ manict, placed on the thage or bafon; $G$, the ftage or bafon; 10,10 , beams that fupport the pieces of which the bafon is compofed; 11, perpendicular pices for fupporting thele beams; $H$, the buckler; R, S, Q, a circular trongh of the apple-mill; T, L, V, compartments or divifions, for different forts of apples; M, the mill-fione; L, M, axis of the mill fone ; $N$, the fpring-tree bar.

CrdFk-Spirit, a firituous liquor crawn from cyder ly diftillation, in the fame manner as brandy from wine. The particular flavour of this fpirit is not the moft "greeable, but it may with cate he divefted wholly of it, and rendered a perfectly pure and infipid $f_{\text {pirit }}$ upon rectifation. The traders in fpirituous liquors are woll enough acquainted with the value of fuch a firit as this: they can give it the flavours of fome other kinds, and fell it under their names, or mix it in large proportion with the foreign brandy, ram, and arrack, ia the fale, without any danger of a difonvery of the che th.

CYDIAS, a painter who made a painting of the Argonats in the itth Olympiad. This celebrated picce was bought by the orator Iortentius for 164 ralents.

CYDNUS (anc. geog.), a river of Ciligia; riling in mount Taurus, to the north of Tarfus, through whene middle it ran, in a very clear and cold Atrean, which had almort proved fatal to Alexander on bathing in it: falling into the fea at a place called Rhegnat, a breach, the fea breabing in there, and affurding
the peopic of Tarfus a Alation or fort for their hips. Cy lonia. The water of the Cydmu is commented by Strabo, as $\underbrace{\text { Cy }}_{\text {-mid }}$ of fervice in nervous diforders and the gout.

CYDONIA (anc. grog.), one of the three mot itlufrious cities of Crete, fituated in the north-weft of the ifland, with a locked port, or walled round. The circumftances of the founding of Cy don are uncertain. Stephen of Byzantium fays, that it was at firt named Apollonia from Cydon the fon of Apollo. Paufanias aferibes the founding of it to Cydon the fon of Tegetus, who travelled into Crete. Herodotus affims. that it was founded by the Sanians, and that its temples .were erected by them. Alexander, in the firt book of the Cretans, infurms us, that it received its name from Cydon the fon of Mercury. Cydon was the larreft city in the ifland; and was enabled to hold the balance between her contending neighbours. She fuftained fome famous fieges. Phalencus, general of the Phoceans, making an expedition into Crete with a fleet and a numeross army, invefted Canea both by fea and land; but lolt his amy and his life before its valls. In fuccerding times, when Metellus fublued the inand. he affarid Cydon with all his forces; and atter combatimy an obtlinate refilance, fulbected it to the power of Kome. Cydon occupied the prefent fituation of Canca; only extending half a league farther towards St Odern; where on the fea fore the remains are Alll to be feen of fome ancient walls which appear to have been of a very folid conflruction. See Capa.

CYDONLA, the qunce; fo called from Cydon, a town of Crete, fumous for its abounding with this fruit. Linnaus has jeined this genus to the anple and pear; but as there is fuch a remarkable diference butween the frnits, we follow Mr Miller, who treats the quince as a genus by itfulf.

Sipecies. 1. The oblonga, with an oblong fruit, lenghened at the bafe. 2 The maliforma, with oval leaves woolly on their under file, and leagthened at their bafe. 3. The hatitanica, with obverfe oval leaves, woolly on their under fide. The:e are fome other varities of this frnit propagated in fruit-gardens, and in the nurferies for fale; one of which is a folt ratable fouit, another very altingent, and a third with a very forll fruit cottony all over, which is farce worth keeping. Thefe Mr Miller fuppofed to be fem nal variations, but the three uthers to be diftind fpecies. The Purtugal quince is the molt vaiuable: its pulp turns to a line purple when fewed or haked, and becomes much fofter and lefs autlere wan the others; fo is mouch fitter for m.king marmal ude. The trees are ail eafily propated, either hy hyer, forkers, or custing; which mall be planted in a moits foil. Thote rifid from fuckers are fldom fo well routed as thofe which are obtuined form cuttings or layers, and are fubject to produce fackers agian in greater plenty; which is not fo proper for frumbeaning trecs. Thefe trios require very little frumins: the chicf thing to be oblerved is, to keep their thems clear from fuckers, ans 1 cut off fuch hranches as crofs each other: likewile all upright luxuriant fhonts from the middle of the tree flould be taken of, that the head my not be too much crowded with wow, which is of ill enfequence to all feni-trees. Thefe forts may alfo be propagated by budding or grafting upon ltoces raifed

## C Y M

Cymons by cutrings ; fo that the beft forts may be eultivated this way in gicater plenty than hy any other inethod. These are allo in ereat dfeem to bud or grafe pears upon; which for fammer or antumo frate are a grent improvement to theta, efpecially thofe delirned for watls and effealiers; for the trees upon thefe thocks do not fhoot fo vigoroully as thofe upon fice-flocks, and therefore nay be kept in lefs compafs, and fooner produce fuest : but hardewinter fruits do not fuccecd fo wedl upon thefe focks, their fruit being fubject to crack, and are commonly lfony, efpecially all the breaking pars: therefort the fe locks are only fit for melting pears and a moift foil.

CYGNUS, or Swan, in ornithology. Sce Anas.
Cygnus, the Swan, in aftronomy, a condllation of the northern hemiphere, between Lyra and $\mathrm{Ce}-$ pheus. The fars in the contlellation Cygnus, in Prolemy's catalogue, are 19 ; in 'l'jcho's i8; in Hevelins's 47; in the Britamic catalogue 81.

CILINDER, in grometry, a folid body fuppefed to be generated by the rotation of a parallelograin.

Kuling, or Loaded Culundre, a eylinder which rolls up an inclned piane; the phenomena of which ase explained under Mechanics.

CYLINDLOOLS, in gecometiy, a folid body, ap proacling to the figure of a cylinder, but differing from it in fome refpectss as having the bafes ehiptical, but parallel ard equal.

CYLINDRUs, in natual hiftory, the manke of a genus of thell.fish, of which there are many tlegant and precions feecies.

CYMA, in botany, the tender Atalks which herbs fend forth in the beginning of the fpring, particulaly thufe of the cabbage kind.

Cyma, or Cymarium, in architecture, a member or monlding of the corniche, the profle of which is waved, that is, concave at top, and convex at bottom.

CYMBAL, , oubaion, a nufical inftrument in ufe among the ancients. The cymbal was made of brafs, like our kettie-trums, and, as fome think, in their form, but fmaller, and of different ufe. Ovid gives eymbals the epithet of genidia, becaule they were whed at weddings and other diverfions.

Caffudorus and Ifdore calh his inftrument acetaonlum, the aume of a cup or cavity of a bone wherein another is articulated; and Xenophon compares it to a horle's hoof; whence it mult have been hollow: which appears, too, from the firute of feveral other things dcnominated from it : as a balm, ealdron, goblet, calk, and even a thoe, fuch as thofe of. Empedocles, which were of brafs.

In reality, the ancient cymbals appear to lave been very different from our kettle drums, and their afe of another bind : to their exterior cavity was fattenced a fandle; whence Phiny compares them to the upper part of the thigh, and Rabanus to phials.

They wete Atruck againft one amother, in cadence, and made a very acute found. 'Their invention was attributed to Cybele; whence their ufe in feaths and facrifices: fetting afide this occafion, they were leldum ufed but by diffolute and effeminate peopl. M. Lampe, who has written exprefsly on the lubje at, atribuics the invention to the Curetes, or inhabitants of monnt Ifa in Crete; it is certain thefe, as will as hl: Cury-
hantes or gascls of the kings of Crcte, and thofe or. Rhodes and samothacia, were reputed to excel in the matic of the cymant.
'like Jens had the ir cymbals, or at leaft influments which tranfators rendes cymbals; but as to their matter and form, critics are ftill in the dark. The modern cyabal is a mean inll rument, chiefly in ufe among vagrante, gyplics, \&e. It contits of iteel wire, in a taingular form, whereon are paffed five rings, which are twached and hifted aloner the triangle with an iron rent bed in the icft hand, while it $i$, fupported in the right by a ring, to give it the freer motion. Dirand.a faye, that the monks ufed the word cymbal for the eluiter-bell ufed to call them to the refectory.

CYME (anc. goog.), a city built by Pclops on his return from Grecec. Cyme the Amazon gave it name, on explling the inhabitants, according to Mely. Latin authors, as Nepos, Livy, Mcla, Pliny, Tacitus, retain the appellation Cyme, after the Greek manatr. It thood in Acolia, between Myrima and Phocaa (Ptolemy); and long after, in Peutinger's map, is fut down nine miles diltant from Myrina.From this place was the Sybilla Cumza, called Ereve them. from Erythre, "a neightuming phace" It wat the comery of Ephorus. Hefiod was a Cumean onf gimbly (Stephanus) ; his father coming to fettle at Aferain liencia.

CYMENE, in botany, a name given by the ancicat. Grets to a plant with which they ufed tu dye woollen things yellow, and with which the women of thofe times ufed affo to tinge the hair yellow, that being the favourite colour in thofe ages. The cymene of the Greeks is cvidently the fame plant with the lute berbe of the Latins; or what we call dyer's sued. See Re. seda.

CINEGIRUS, an Athenian, eelebrated for his extraordinary conarage. He was brother to the poet Nfchylus. After the battle of Marathon, he purfued the fying Perfians to their thips, and feized one of cheir velfils with his right hand, which was immediately fevered by the enemy. Upon this he fuized the veffel with his left hand, and when he had loft that alfo, he ttill kept his hold with his teeth.

CYNANCHE, a fpecies of quinzy, in which the tongue is inflamed and fwelled, fo that it haness out beyoud the teeth.

CYNANCHUM, bastard dogsbane: A genus of the digymia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 3 oth order, Contorta. The nettariun is cylindrical and quinquedentated. There are fix fpecies; of which. the following are the moft remarkable. 1. The acutum, rommonly called Monipelier famm:ony; and, 2. The monfeliacum, or round-leaved Montpelier feammony. They ahound with a milky juice like the fpurge, which iffues out wherever they are broken; and this mill.y juice when eoncreted has frequently* been fold for cammony. Thefe plants propagate fo fatt by their crepring roots, that few people care to admit them into gardens.

CYNARA, the Artichoze, A genus of the polygamia requalis order, belonging to the fyngenefia clats of plants. The calyx is dilated, imbricated with carnous fquamx, and emarginated with a Anary point.

Cyre リ C'ymara.

## C Y N [ 632 ] C Y N

Cynara. Of this genus there are four fpecies, but only two are cultivated for ufe.

1. The fcolynius, or garden artichoke, hath large, thick, perennial roots, crowned by a confiderable cluiter of large pennatifd, evect leaves, two or three fect long. In the middle are upright ltalks rifing a yard high, on the top of which is a large round foaty head, compuled of numerous, oval, calycinal feales, inclofing the for ts, fitting on a broad Helhy receptacle, which, with the Hethy bafe of the feales, is the only catable pat of che plant. The varieties of this fpecies are, (1.) The conical grem-headed Jrencla atichoke, hat ving the fimall leaves temitated by feinte, a tail ftalk, the head fomewhat conical, and of a light green colour, with the foles pointed at top, opening and toming outward. (a.) The globular headed red Dutch artichoke, having leaves without fuines, a Atrong ttalk, the hoad large, ghbular, a little comprelfod at top, and of a redith.green colour ; broad obtale feales emarginated at top, growing clole, and turning inward. Of the fe ratieties the latt is defervedly the mort eftemed, both on account of is fupciority in lize and the agrecablene fs of its favour. Buch varteties are perennial in their root: but the leaves aud fruitflem die to the ground in winter; and their roots remaining, fend up freth leaves and itens every fummer, producing a fupply of artichokes for 20 years if required. The flowers and feed of all the plants of this gerus are produced in the centre of the liead; the feales of which are the proper calyx of the flower, which confifts of numerous finall bluifh Horets, fucceeded by downy feeds fitting naked on the receptacle.
2. The cardunculus, or cardoon, greatly refembles the artichoke, but is of larger and more segular growth; the leaves being more upright, tafler, broader, and more regularly divided; and the dalks of the leaves blanched are the only eatable parts of the plant.

Culture. Both the varietits of the artichoke are propagated by flips or fuckers, ariling annually from the thool or root of the old plants in tpring, which are to be taken from good plants of any prefent plantation in March or the beginning of Apill, and planted in the upen quater of the kitchen-garsen, in rows five fect afunder; and they will produce artichakes the tane year in autumn. It hould, however, be temarked, that though artichokes are of many years duration, the annual produce of their fruit will gradually leffon in the fize of the eatable faits after the thind or fourth year, fo that a frefl plantation fhould be made every thrse er four years. The cardoon is a very hardy plant, and profpers in the open quarteis of the kitchen-garden. It is propagated Ey lied fowed annaally in the full ground in March; either in a bed for tranfplantation, or in the place where they are defigned to remain. The plants art very large, fo muft fand at confiderable diftances from one another. Dy this means you may have fome fmall temporary ctops between the rows, as of lettuce, fpinach, eudive, cabbage, favoy, or bioccoli plants. In the latter end of September, or in October, the cardoons will be grown very large, and incir foottalks have acquired a thick fubllance; you mul then tie up the leares of each plant, to admit of earthing them clofely all round for blancling, which will take up fix or eight weeks; and thas the plants will come N 96.
in for ufe in November and December, and continue all winter.

CYNAUUS of Theffalv, the feholar of D monhenes, flourithed 275 years before Chrif. Pyuhus had fo bigh an etteem for him, that he fent him to Rome to folicit a peace; and fo raft was his memory, that the day after his arrisal he faluted all the fenators and knights by name. Pyrhus and he wrote a Treatife of War, quosed by Tuly.

CINICS, a lect of ancient philofophers, who valued themfelves upon their contempt of riches and Rate, alts and fcicnces, and every thing, in fhort, except virtue or morality.

The cynic pltilofophers owe their origin and infttation to Anifhenes of Athens, a difeiple of Sucrates; who being alked of what ufe tis philolophy had been to him, replied, "It enables me to live with mylelf." 1) ioneres was the motl famons of his difciples, in whente life the fyltem of this philofophy appears in its graatect perfection. He led a molt uretched life, a tub having ferved him for a lodring, which he rolled before hom whercver he went. Yet he was nevertheleis not the more humble on account of his ragged clak, hag, and tub; for one day entering Plato's houle, at a time when there was a fplendid entertaiament there for feveral perfons of ditlinction. he jumped up upon a very rich couch in all his dint, fayirg, "I tiainple on the pride of Piato." "Yes (replied Piato), but with great pride, Diogenes." He had the utmolt contempt for all the hunan race: for he walkod the freets of Athens at noon day with a lighted latithorn in his hand, telling the people, "He was in fearch of a man." Amongf many excellent maxims of morality, he held fome very pernicious opinions; for he uled to fay, that the mintermpted good fortune of Harpalus, who generally paffed for a thicf and a robber, was a teftimony againlt the gods. Fie regarded chettity and modelty as weaknefles: hence Laertius obferves of him, that he didevery thing openly, whether it belonged to Ceres or Venus: though lie adds, that Diogenes only ran to an excets of impudence to put others out of conceit with it. Bat impus. dence was the chara\&teritic of thele philofophers; who argued, that what was right io be done, mithe be done at all times and in all places. The chief principle of this fect, in common with the tloics, was, that we fhould folluw mature. But they difered from the fuics in their explanation of that maxim; the cyaies being of opinion, that a man followed nature that gratifed his natural motions and appetites; while the fiois underluond riglat reafon by the word nature.

Cuxic $S_{6} r / m$, a kind of convulfon, wherein the patient imitates the howlings of dugs.

CYNIPS, in zoology, a gouns of infects belonging to the hymenoptera order. The month is armed with jaws, but has no probofeis: the inng is fpiral, and modly concealed within the body. The querens folii, or oak-leaf eynipz, is of a burnihed faining brown colour. The antemme are black; the legs and feet of a chefnut-brown; and the wings white, but void of margitial fpots. It it in the little fmooth, sound, hard gialls, found under the oak-leaves, gencrally fatlened to the fibres, that this inlect is procuced, a fingle one in each gall. Thefe latter are ligncous, of a hard compact ( ( it)-

## C Y N $[633] \quad$ C Y P

the fap of the leaf, occafioned by the puncture of the gall-fly when it depofits its egrgs. Sonetimes, inftead of the cynips, there is feen to proceed from the gall a larger inlect of a brown colour, which is an ichneumon. This ichneumon is not the real inmate of the gall, or he that formed it. He is a parafite, whofe mother depofited her egg in the yet tender gall; which, when hatched, brings forth a larva that dettroys the larva of the cynips, and then comes out when it has undergone its metamorphofis and acquired its wings.

The quercus gemmx, or oak-hud cynips, is of a very datk green, flightly gilded: its antenna and feet are of a dun colour, rather deep. It depofits its eggs in the oak buds, which produces one of the finelt galls, leafed like a rofe-bud beginning to blow. When the gall is fmall, that great quantity of leaves is compreffed, and they are fet one upon another like the tiles of a roof. In the centse of the gall there is a kind of ligneous kernel, in the middle of which is a cavity; and is, that is found the little larva, who feeds there, takes its growtl, undergoes its metamorphofis, and breaks throngh the inclufure of that kind of cod in order to get out. The whole gall is often near an inch in diameter, fometimes more when dried and difplayed ; and it holds to a branch by a pedicle.

There are a great number of other fpecies.
CYNOCEPHALUS, in zoology, the trivial name of a pecies of Simia.

CYNOGLOSSUM, hound's tongue: A genus of the monogynia order, belonging to the pentandria clals of plants; and in the natural method ranking under the 41 ft order, Afperifolis. The corolla is funnelthaped, with its throat clofed up by little arches formed in it; the feeds depreffed, and affixed to the tyle or receptacle only on their inner fide. There are cight fpecies, none of them remarkable for their beauty. The root of one of them, riz. the officinale, or common greater hound's tongue, was formerly ufed in' medicine, and fuppofed to poffers narcotic virtues; but it is difearded from the prefent practice. The fmell of the whole plant is very difagrecable. Goats eat it : fheep, horfes. and fwine refufe it.

CYNOMETRA, in botany : A genus of the monosynia order, belonging to the decandria clafs of plants: and in the natural method ranking with thofe of which the oider is doubtful. The calyx is tetraphyllous; the anthere bifid at top; the legumen carnous, crefcent-fhaped, and monofpermous.

CYNOMORIUM, in botany: A grenus of the monandtia order, belonging to the monocia clafs of plants; and in the natural method ranking under the 50 h order, Amentaces. The male calyx is an imbricated catkin; there is no corolla: the calyx of the fcmale is in the fame catkin; no corotla; one ttyle; and one roundifh feed.

CYNOPHONTIS, in antiquity, a feltival oblerved in the dog.days at Argos, and fo called $\alpha \pi 0$ fus xuvas ecu c., i.e. from killing dogs; becaufe it was ufual on this day to kill all the dogs they met with.

CYNOREXY, es: immoderate appetite, to the degree ot a difeafe: called allo fames canina and bulimy.

CYNOSA RGES, a place in the fuburbs of Athens, named from a vaitie or fwift dog, who fnatched away part of the facrifice offering to Hercules. It had a

Vos. V. Fart II.
gymnatium, in which ftrangers or thofe of the halfblood performed their cxercifes; the cale of Hercules, to whom the place was confecrated. It had alfo a court of judicature, to try illegitimacy, and to examine whether perfons were Athenians of the whole or half blood. Here Antilthenes fet up a new fect of philofophers called Cynics, either from the place, or from the fnarling or the impudent difpofition of that fect.

CYNOSCEPHALIE (anc. geog.), a place in Theffaly near Scotuffa; where the Romans, under Q. Flaminins, gained a great victory over Philip, fon of Demetrius king of Macedon. Thefe Cynofeephalx are fmall tops of feveral equal eminences; named from their refemblance to dogs heads, according to Plu. tarch.

CYNOSSEMA, the tomb of Hecuba, on the promontory Mallufia, over againll Sigeum, in the foutls of the Cherfonefus Thracia; named either from the figure of a dog, to which the was changed, or from her fad reverle of fortune (Pliny, Mela).

CYNOSURA, in attronomy, a denomination given by the Greeks to urfa minor, or " the little bear," by which failors theer their courfe. The word is formed of xuvarespx, q. d. the dog's tail. This is the conitellation next our pole, confifting of feven ftars; four whereof are difpofed like the four wheels of a chariot, and three lengthwife reprefenting the beam; whence fome give it the name of the chariot, or Charles's auain.

Cynosura, Cyinofura, or Cynofuris, (anc. geog.), a place in Laconica; but whether maritime or inland, uncertain. Here AEfculapius, being thunderftruck, was buried (Cicero).

Cynosura was alfo the name of the promontory of Marathon in Attica, obverted to Euborit.

Cynosura, in mythology, a nymph of Idain Crete. She nurfed Jupiter, who changed her into a far which bears the fame name. It is the fame as the urfa minor.

CYNOSURUS, in botany: A genus of the digynia order, belonging to the triandria clafs of plants; and in the natural method ranking under the 4 th order, Gramina. The calyx is bivalved and multiforous; the receptacle proper, unilateral, and foliaceous. There are ten fpecies, four of which are natives of Britain, vis. the criftatus, or crefted dog-tail grafs ; the echinatus, or rough dogetail-grafs; the cxruleus, or blue dug-tail grafs; and the paniceus, or bearded dug tail grafs.

CYNTHIUS and Cvnthia, in mythology, furnames of Apollo and Diana, derived from Cynthia the name of a monntain in the middle of the ifland of Delos.

CYNTHUS (anc. geog.), a mountain of the ifland Delos, fo high as to overfladow the whole ifland. On this mountain Latona brought forth Apollo and Diatia: hence the epithet Cynthius (Virgil), and Cynthia (Lucan, Statius).

CYNURIA, or Crnerit's Alycr, (anc. geog.), a dittrict of Laconica, on the contines of Argoli-. A territory that proved a perpetual hone of contention between the Argives and Spartans (Thucydides). For the wanner of deciding the difpute, fee Thyrea.

CYPERUS, in botany: A genus of the monogynia order, belonging to the triandria clafs of llants; $+1$

## Csnofic.

 phata. II Cyperus.
## C Y P [ 634 ] C Y P

Cyghon and in the natural method ranking under the 3 dorder, Colamariz. The glumer are pateaceous, and imbricated towardstabh fide: the corolla is wanting, and thare is one nakd feed. There are 20 fpecies; the only remarkable are the round and the long fweet cyperus. The former is a native of the Eaft Indies, and grows by the fides of sioulds, ditches, and the like. The root is knotty, wrapped round with firmous drings not eafy to brak, of a beown colour without and grey within; of a pleafant feent, efpecin!ly when freth and well dried; the leaves are green, and refembie thofe of the reed and leek. The latter, commonly called Englif? or Flemife cyorts, grows in the water, and aleng banks and river lides. Its root is as thick: as an olive, full of little knots or fpecks, of an whowe figure, grey colutir, fweet and fomewhat iharp tafle, and almolt without fmoll when it is newly taken out of the ground. The roots of both plants are eftemen cordia!, diuretic, and cephalic, wfitera of poitons, and expellers of wind. Long cyperus is much ufed by perfumers and glovers.

CYPHON, in antiquity, a kind of punifhment ufed Ey the Athenians. It was a collar made of wood : fo called hecaufe it conflained the criminal who had this punithment infliced on lim to bow down his head.

CYPHONISM, Ciphonismus, from xupur, which Has various fignifications; derived from xupos, crooked: a kind of terture or punifment in ufe among the ancients.

The learned are at a jofs to determine what it was. Some will have it to be that mentioned by St Jerom in his Life of Paul the Hormit, clap. 2. which conflted in fmearing the body over with honey, and thus expofing the perfon, with his hands tied, to the watm flun, to invite the flies and other vermin to perfecute him.

CYPR EA, or Gowrie, iń zoology, a genus of infects belonging to the order of vernies tenacea. It is an animal of the limax or faril kind; the fhell is one involuted, fubovated, obtufe, fmooth valve. The aperture on each fide is linear, longitudinal, and teethed. There are 44 fpecies, diflinguithed by the form of their fhells. 'The pediculus, or common gowric, is seprefented on Plate CLIV.

This genus is called cypraa and venerea from its being peculiarly dedicated to Venus; who is faid to have endowed a fhell of this genus with the powers of a remora, fo as to impede the courfe of the Mip which was fout by Periander tyrant of Corinth with orders to caItrate the young nobility of Corcyra.

CYPRESS. See Cupressus.
CYPRIANUS (Thafcius-Cæcilius), a principal father of the Chritian church, was born at Carthage in Africa, at the latter end of the fecond or beginning of the third century. We know notling more of his parents than that they were heathens; and he himfelf continued fuch till the laft 12 years of his life. He applied himfelf early to the fudy of oratory; and fome of the ancients, particularly Lactantius, inform us, that he taught metoric in Carchage with the highent applaufe. Cyprian's converfion is fixed by Pearfon to the year 246 ; and was at Carthage, where, as St Jerome obferves, he had often employed his rhetoric in the defence of paganifm. It was brought about by one Cascilius, a prict of the church of Car-
thage, whofe name Cyprian afterwards took; and be- Cypriany tween whom there ever after fubfilled fo clofe a Friendmip, that Cacilius at his death committed to Cy prian the care of his family. Cyprian was alfo a married man himfelf; but as foon as lee was converted to the faith, he rofeived upon a tate of continence, which was thought a hiegh degree of piety, as not being yet become general. Peing now a Chrittian, he was to give the aftal proof of the fncerity of his converfion; and that was hy witing ayain! paranim and in defence of Chrilianicy. Whith blis view he compored his piece De Gratio Dei, "or concerning the grace of God," which he acolefted to Domatus. It is a wolk of the fame nature with the ipologetie of Tertullian, and the Octavius of Mimutus Felix. He nest compoled a piece De İonerum z"antate, or "upon the vanity of idols." Cyprian's behaviout, both. before and after his baptifm, was fis hishly plating to the bithop of Carthage, that he ordaned hima prieft a few months after. It was rather irregular to ordain a man thus in his very noviciate; but Cyprian was fo eatraordinary a perfon, and the ught capable of doing fuch finglular fervice to the church, that it feemed alhowable in this cafe to difpenfe a little with the form and difcipline of it. For belides his known talents as a fecular man, he had acquired a high reputation of fanctity lince his convertion; having not only feparated himidf from his wife, as we have obferred before, which in thofe days was thought an ex. traordinary act of piety, but alfo configned over all his goods to the poor, and given himfelf up entirely. to the things of God. It was on this account no doubt, too, that when the bithop of Carthage died the year after, that is, in the year 248 , none was judged fo proper to fuccoed him as Cypian. The quict and repole which the Chrillians had enjoyed during the latt 40 jears, had, it feems, greaty corrupied their manners; and therefore Cyprian's firt care, after his advancement to the bifheric, was to correct diforders and reform abufes. Laxury was prevalent among them; and many of their women were not fo frict as they fhould be, efpecially in the article of drefs. This occalioned him to drew up his picce $D$ e labitu rirginum, or "concerning the drefs of young wemen ;" in which, befides what ine lays on that patticular head, he inculcates many leffons of modelly and fobiety: In the year 249, the emperor Decius began to iffue out very fevele edicts againg the ChriGians, which particultrly affected thote upn the coalt of Africa: and in the beginning of 250 , the beathens, in the circus and amphitheatre of Cathage. inffted loudly upon Cyprian's being thrown to the lions: a common method of dellroying the primitive Chrillians. Cyprian upon this withdrew from his church at Carthage, and fled into retirement, to avoid the furg. of the perfecutions. He wrote in the place of his retreat, pioss and intructive letters in thole who had been his hearers; and alio to the libcllatici, a name by which thofe pufllanimous Chrillians were called, who procured cerificates of the heathen wagiftrates, to thow that they had complied with the emperor's orders in facrificing to idols. At his return to Carthage he held feveral councils on the repentance of thofe who had fallen during this perfecution, and other points of difcipline; he oppofed the fehemes of Navatua and

## C Y I <br> [ 635 ] C Y

Cyrrinus Novatianus; and contended for the rebaptifing of thofe who had been baptifed by heretics. At laft he died a martyrin the perfccution of Valerian and Gallienus, in 258. Cyprian wrote 81 leticrs, and feveral treatifes. The befl edition of his works are thofe of Pamelius in 1568 ; of Rigaltius in 1648; and of Oxford in 1682. His words have alfo been tranlated into Englifh by Dr Marfhell.
CYPRINUS, in ichthyology; a genus of fifhes, belonging to the order of abdominales. The month is toothlefs; there are three rays in the gills; the body is fmooth and white; and the belly fins have frequently nine tays. There are 31 fpecies, principally dillinguifed by the number of rays in the vent-fin. The moll remarkable are,

1. The carpio, or carp. This was introduced into England about the year 15 '4, by Leonard Mafulal, to whom we are alfor indebted for that excellent apple the pepin. Ruffia wants thefe liff at this day. Sweden has them only in the ponds of people of fathion. They chiefly abound in the rivers and takes of Polith Pruffa, where they are fometincs taken of a vall fize. They are there a great article of commerce, and fent in wellboats to Siveden and Ruffia. The merchants purchafe them out of the waters, of the nobletfe of the conntry, who draw a good revenue from this article. The allcients do not feparaie the carp from the fea- finh. They are fometimes found in the harbour of Dantzic between the town and a place called Heh.

Carp are very long-lived. Gefner brings an inftance of one that was near 100 years old. They grow alfo to a very great fize; fome authors fpeak of carp weighing 200 pounds weight, and five feet in length. The carp is a prodigious breeder: its quantity of roe has been fometimes found fo great, that when taken out and weighed againt the fifh itfelf, the former has been found to preponderate. From the fpawn of this fifh, caviate is made for the Jews, who hold the fturgeon in abtorncnce. The carp is extremely cunning, and on that account is fometimes flyled the river-fox. They will fometimes leap over the nets and efcape that way; at other times they will inmerfe themfelves for deep in the mad as to let the net pafs over then. They are alfo very fhy in taking a bair: yet at the fpawning-time they are fo fimple as to fuffer themfelves to be tickled, handled, and caught by any body that will attempt it. This fifh is apt to mix its mile with the roe of other fift ; from which is produced a [pmious breed, as has been obferved in the off. fpring of the carp and tench, which bore the greateit refemblance to the firtl. The fame has aldo been obferved of the carp and bream.

In Polifin Pruliza, and many other parts of Germany, the fale of carp confitutes a part of the uvenue of the mobility and genery: fo that the proper management of that filh is redncerd in a kind of fyltem, fonaded on the experience of feveral generations. Of the methods there practifed, we have an account in the PhiWofophical Tranfastions for 1771, art. 37. commanicated by Mr J. Reinhold. Forfler; wholays, he has feen carp treated and maintained according to thofe methods, "above a yard loner, and of 25 pounts weight ;" but had no opportunity of afertaining their age. "In the pond, howevtr, at Charlottenburg (he adds), a palace belonging to the king of Rrullia, I faw wore
thas two or thee humdred carp, between two and Cymana. three feet lons; and I was told by the keeper they were between 50 and 60 ycars ftanding. They were tame, and came to the fare in order to be fud; they fwallowd with eafe a piece of white bread of the fize of half a half penny rell." - Mr Forller, in this paper, alfo vouches a mofl extraserlinary circumance, namely, the polfibilicy of the carp's mot only living for a confiderable time out of water, but of ins growing fat in ite new element. The anthor has feen the ex. periment fuccefffully tried, and attended to the whole procels, in a nobleman's howfe where he then refided, in the principality of Anhalt-Dufan. The ith being taken out of the water, is wapped up in a large quantity of wet mofs, ipread on a picce of neet, which $i_{3}$ then gathered into a purfe; in fuch a man:er, however, as to allow him room to breathe. Thie net is then plunged into water, and hung ap to the cieting of a cellar. At lirlt the dipping mut be repeated $e$ very three or four hours; tut afterwards the carp need only to be planged into the water once in about fix or leven honts. Bread foaked in milk is ande given him in fnall quantitics. In a fhort time, the tifin will bear more, and grow fat under this feemingly unnatural treatment. Mr Dainss Barrington, in a note, confirms a part of the preceding account, by mentioning the practice of a cettain fihmonger near Claremarket, who, in the winter, frequeutly expofes a buthel at lealt of carp and tench, fur fale, in the fanc dery velfel, for fix or feven hours: many of which are not fuld, and yet continue in hedth, though breathing nothing but air, during the time above mentioned, for fereal days fucceffively.
2. The barbus, or barbel, is fo exiremely cuarfe as to be overlooked by the ancients till the time of the poct Aufonius, who gives it no gleat character. They Frequent the aill and deep parts of civers, and live in focicty, rooting like fwine with their nofes in the fort banks. It is fo came as to fuffer itfelf to be taken by the hand; and people have been known to take numbers by diving for them. In fammer they move about during wight in fearch of food; but towards autuma, and during winter, confine themfelves to the deepelt holes. The barbel is about the length of three feer, and will waigh 18 pounds; the belly white; the dorfal fin is armed with a remarkable flrong Spine, fhatply ferrated, with which it can inflict a very fevere and dangrerous wound on the incantious handler, and even do much damage to nets. They are the worf and coariftl of frefh-water fith, and feldom eaten but by the poorer fort of people, who fonctimes boil then with a bit of bacon to give them a retifh. Their roe is very noxions, affecting thofe who unwarily eat of it with a nauke, vomiting, purging, and a hight fwelline.
3. The tinca, or tench, was treated with the fame diffefpect by the ancients as the batber; but is now in much more repute. Whas by fome been called the phyrian of the lift; and its llime has been faid to be of io lecaling a nature, that the wounded fikhes apply it as a Atyptic. In chis conntry it is reckoned a wholefome and delicious food; but the Germans are of a different opiniun. By way of contempt they call it the Bomomer. Gefner even iays, that it is infipid and unwhalefome. It does not commonly exceed four or five

## C Y P [636] C Y P

Eyprinus. pounds in weight, though fome have been known to weigh ten or iwenty. They love fill waters, and are sarely found in rivers: they are very foolifh and eafily caught. The tench is thick and fhort in proportion to its length. The colour of the back is dufky; the dorfal and ventral fins of the fame colour; the head, fides, and helly, of a greenifh caft, molt beautifully mixed with gold, which is in its greateft fplendor when the fifh is in the highert feafon.

4 The quakeon is genetally found in gentle treams, and is of a fmall fize, the largeit not exceeding half a pound weight. They bite eagerly; and are affembled by raking the bed of the river; to this foot they immediately crowd in fhoals, in expectation of food.
5. The brana, or bream, is an inhabitant of lakes, or the deep parts of thill rivers. It is a filh that is very little etteemed, being extiemely infipid.
6. The rutilus, or roach, is a common fifh, found in many of the deep till rivers of this country. They are gregarious, keeping in large fhoals. It has never been known to exceed live pounds in weight.
7. The leucifcus, or dace, like the roach is gregarious, haunts the fame places, is a great breeder, very lively, and during fimmer is very fond of frolickiag near the furface of the water. It never exceeds the weight of a pound and an half: the feales are finaller than thafe of the roach.
S. The cephalus, or chob, is a very coarfe filh and full of bones. It frequents the deep holes of rivers; and in fummer commonly lies on the furface beneath the flade of fome tree or buth. It is very timid. finking to the bottom on the lealt alarm, even at the paffing of a fladow; but they will foon refune their former fituation. It leeds on worms, caterpillars, grafshoppers, and other coleopterous infects that happen to fall into the water; and it will even feed on cray-fith. It will rife to a fly. Some of this kind have been known to weigh eight or nine pounds.
9. The aburnus, or bleak. Thefe fith are very common in many of our rivers, and keep together in large thoals At ecrtain feafons they feem to be in preat agonies: they tumble about near the furface of the water, and are incapable of fwimming far from the place; but in about two hours they recover and difappear. Fifh thus affceted, the Thames fihermen call mad bleaks. They feem to be troubled with a fpecirs of gordziss, or hair-worm, which torments them fo, that they rife to the furface and then die. The bleak feldom exceeds five or fix inches in length. Artificial pearls are made with the fcales of this lith, and probathly alio with thofe of the dace. They are beat into a fine powder, then diluted with water, and introduced into a thin glafo bubble, which is afterwards flled with wan. The Frencl were the inventors of this art During the month of July there appear in the Thames, near Blackwall and Greenwich, innumerable muititudes or fmall fih, known to the Londoners Ey the name ci white bait. They are efteemed very delicious when fricd with fine flour, and occafion, dusing the feafon, a valt refort of the lower order of epicures to the taverns at the places where they are taken at. There are vatious fupprfations concerning thefe nhes, all of which terminate in reckoning them the fry of fome other fing. Mr Pensant thinks they are
of the carp kind, though he cannot determine the Cyprinys. fpecies to which they belong. They have a greater fimilarity to the bleak than to any other, but he thinks they cannot be the young fry of this fpeciea; becaufe the bleak is found in many of the Britifh ftreams, but the white bait only in the Thames. The ufual length of this lifh is only two inches.
10. The auratus, or golden fifh, a fmall fif domefticated by the Chinefe, and generally kept for ornament by great people in their courts and gardens. They breed them in fanall ponds made for the purpofe, in bafons, and even in porcelain vefficls. This fiflh is no larger than our pilehard. The male is of a bright red colour from the top of the head to the middle of the body: the relt is of a gold-colour; but it is fo bright and fplendid, that the fineft gilding, aceording to F. le Comte, cannot approach it. The female is white ; but its tail and half of its body refemble the luttre of filver. F. du Halde, however, obferves, that a red and white colour are not always the diftinguifhing marks of the male and female; but that the females are known by feveral white fpots which are feen round the orifices that ferve them as organs of hearing, and the males, by having thefe fpots much brighter. Gold finh are light and lively; they love io fpart on the furface of the water, foon become familiarifed, and may even be accultomed to come and receive their food on founding a fnall rattle. Great care is necef Grgere's fary to preferve them; for they arc extremely deli Deffriptios cate, and fenfible of the lealt injuries of the air: af Chista. lond noile, fuch as that of thunder or caunons; a Atrong frell, a violent fhaking of the veffel, or a fingle touch, will oft-times deftroy them. Thefe fifh live with little nourihment : thofe fmall worms which are engendered in the water, or the earthy particles that are mixed with it, are fufficient for their food. The Chinefe, however, take care, from time to time, to throw inth the balons and refervoirs where they are kept fmall balls of pafte, which they are very fond of when diffulved; they give them alfo lean pork dried in the fun and reduced to a fine and delicate pouder, and fometimes fnails: the glime which thefe infects leave at the bottom of the veffel is a great dilicacy for them, and they eagerly haften to feed on it. In winter they are semoved from the court to a warm chanber, where they are kept generally fhut up in a porcelain veffel. During that feafon they receive no nourifhment ; however, in fpring, when they are carried back to their former bafon, they fort and play with the fame ftrength and livelinefs as they did the preceding year.

In warm countries thefe fifh multiply fat, provided care be taken to collect their fpawn, which floats on the water, and which they almoft entirely devour. This fpawn is put into a particular veffel expofed to the fun, and preferved there until vivified by the heat: gold-fift, however, feldom multiply when they are kept in clofe vafes, becaufe they are then too much confined. In order to render them fruitful, they mult be put into tefervoirs of confiderable depth in fore places. at kat, and which are contiantly fupplied with frefh water. At. a certain time of the year, a prodigious number of barks may be feen in the great river Yans-tic-kiang, which go thither to purchafe the fpawn of thele filh.

Cyprin:s fint. Towards the nouth of May, the neighounng in$\underbrace{\text { Cyprus. }}$ habitants thut up the river in fiveral places wish matsand hurdles, which occupy an extent of almont nine or ten leagues; and they leave orly a fpace in the middle furf. ficient for the paffage of barks. The fpawn of the firh, which the Clinefe can ditinguin at firf fight, although a Atranger colld perceive no traces of it in the water, is fopped by ti e!e hurdles. The water mixed with fpawn is tiven drawn up, and after it has been put into la ge veffels, it is fold to merchante, who tran port it afterwa ds to every part of the er pire. This water is fold hy meafure, and purchared by thofe who are defirous of thecking their ponds and refervoirs with tifh.
Nowithllanding the tendernefs of thefe fith even in their native climates, they are now naturalized in Britain, where they cven breed. They were fint introduced into England about he year i69t; but were not generally known till 1728 , when a great number were brought over, and prefented filt to Sir Matthew Dekker, and by him circulated sound the neighbourhood of London, from whenee they have been dillributed to moft parts of the country.
Nothing can be more amufing than a grlafo bowl containing fuch fifhes: the duuble refractions of the glafs and water repifent them, when moving, in a thifting and changeable varitty of dimenions, fhades, and colours; while the two mediums, affited by the concavo-convex fhape of the veftel, magnify and ditort them vally; not to mention that the introduction of another element and its inhabitants into our parlours engages the fancy in a very agreeable manner. Sume people exhibit this fort of firin in a very fanciful way; for they caufe a glafs bowl to be blown with a large hollow pace within that does not communicate with it. In this eavity they put a bid oceafionally; fo that you may fee a goldfinch or a linnet hopping as it were in the midtt of the water, and the fifmes fwimming in a circle round it. The fimple exhilition of the fibles is agreeable and pleafont; but in fo complicated a way becomes whirafical and unnatural, and liable to the objection due to him.

Quit uriare cupit rem prodigialiticr unan.
CYPRIPEDIUM, the lady's slipprr, in botany: A genus of the diandria order, belonging to the gynandria elafs of plants; and in the naturd method ranking under the 7 th order, Oribided. The neetarium is ventricofe, inflated, and hollow. These are three fpecies; of which only one, viz. the calceolus, is a native of Britain. It grows in rough ground in different parts of the ifland. The other fpecies are natives of America. Note of them are eafly propagated in gardens, and therefore mult be tranfplanted riom thofe places where they are natives.

CYPRUS, an inland fitnated in the Levant, or moft eafterly part of the Meditertanean fea, betwcen 33 and 36 degrees of eaft longitude, and 30 and 34 of north latitude. In ancient times this ifind was known by the names of Acamis, Ceratlis, Afpalia, Amathus, Macaria, Cryptos, Colinia, Sphecia, Paphia, Salaminia Enofa, and Cyprus. The elymologies of thefe names are neither $v=1$ y tailly found, nor are they of much importance. The name by which it was moll generally knowas is tha: of Cyprus, faid to he derived from cyifros, the name of a flarub or tree with which the inland abounded; fugpofed to be the cyprefs.

Cyprus, according to Eratoflhenes, was firft difcovered by the Pinceacians, two we three sencradions before the days of Alberius and Minos kinys of Crete; that is, according to $\mathrm{S}^{\prime \prime} \mathrm{r}$ laace Newton's computation, 2005 y ars before the Chrittian erd. It was at that time to fall of wood that it eould nos be tilled, and the Phenicians firt cut down that woo! for melting copper, with which the ifard abounded; and afterwads, when they began to fail withnu: Sear on the Mditerranean, that is, after the Trojan war, they built great navies of the werd produced on the illand. Jofephus, however, informs us, that the ceteencidnto of Citiom, the fon of Javan, and grandion of Japhat, were the uriginal inhabitants of Cyprus. Accurding to his account, Cittim, fecing bis brocher Tarlhilh fettled in Cilicia where he built the city of Tarfus, fettled with his followers in this oppolite ifland; and tither he or his defeendants laid the founjations of the eity of Citiun, which, according to Ptolemy, was the moif ancient in the illand. As Cyprus was too narrow to contain the great numbers who attended him, he left here as many as michit ferve to people the comery, and with the rett paffed over into Macedom.

The illand of Cyprus was divided among feveral petty kings till the time of Cyrus the Great. He fubducd them all ; but left each in poffefinou of his king. do $n$ : obliging them only to pay him an annual tribuce, and to fend fupplies of inen, monty, and thips, when required. Tie Cyprian princes lived thus fubject to the Perfians till the reign of Darius Hyftafpes, when they attempted to thake off the yoke, but with bad fuceefs; their forces being entirely defeated, and themfelves again obliged to fubmit. 'They made another more fuccefsful attempt about the year before Chrilt 357 ; but, however, could never totally free themtelvea from their fubjection. It is very probable that they fubmitted to Alexander the Grear, though hiftorians are filent as to that event. On the death of the Macedonian eonqueror, the domimion of Cypurs was difputed by Antigonus and P'toleny the fon of Lagus. At latt Antigonus prevailed, and the whole ifland fubmitted to him about 30.4 years before Chait. He and his fon Denetrius kept pofefion of it for it years, when it was recovered by Ptolemy, and quietly poffeffed by hin and his defcendants till 58 years before Chrif, when it was mott unjully reized by the Romans. In the time of Augultus, it began to be rank. ed among the procoufular provinces, and to be grovern. ed by magitrates fent thither by the fenace. In the year 648 it was conquered by the Saracens; but recovered by the Romans in 357. They held it, however, but for a very thort time, and the barbarians kept poifeffion of it thli the time of the croifades. It was then reduced by the coofaders; and Richard I. of England gave it to the princes of the Lalliznan farnily, who held it till the yar 5970 'llhey divided it into 82 pinvinces, in each of which was a capital city froma which the province was denominated. $S$, conflder. able was the innd at this time, that belides the cities above mentioned, and others of lefs note, it contain. ed 802 villages. In 1570 it was taken hy the Tarks, and thongh it hath ever fince continued mader their tyranmical yoke, is till fo confiderable ats to be govern. ed by a beflerbeg, and feven fangiacs under him.

The air in this ifand is for the molt part wery un-

## $\begin{array}{llll}\mathrm{C} & \mathrm{H} & {[638]} & \mathrm{C} Y \mathrm{R}\end{array}$

Cy:a!no, CYrenatca.
wholefome, on account of the many fens and marthes with which the country abounds. The foil is an excellent fertile elay; and would produce all the neceffalies of hice in ahundance, if properly cultivated. There are but few fprings or rivers in this iffand; fo shat when the rains do not fall plentifully at the ufual feafons, the inhabitants are much diftrefted by the faacity of water. By reafon of the uncultivated late of the country, they are alfo greatly infefted with poifonons reptiles of various kinds. The pempleare extremely ignorant and lafcisions, as indsed they are romach. ad to have been from the remoteft antigity. Ancieatly the workip of Venus was eftubhmed in this ifand, Whence her title amone the poets of the Cypriwe quen? and fuch an inclinatiun bad the inhabitants to beenme the voturies of this goddefs, both in theory and practiee, that the young women uled to prollitute themfelves in her temple in order to raife themfelves portions. Nior are their fuectiors daid to be much better at this day. The exports of the ifland are filks, of, cotton. wine, falt, and thrpentine: the imports are French and tenetion broad cloths; and fometimes a few bales of Englifa manufacure, cutlery wares, fugar, tin, lead, \&ic.

Kn: hats of Cano-s, an order in Rituted by Guy de Lungnan, titular king of Jerufalem, to whom Richard 1. of Engiand, after conquering this inand, made over his right.

C ${ }^{2}$ RANO (Dergerac), a French author, borm in Euicony, about the year idzo. He firl enterec into the army, where his natural courage engaged him fiequently in derels in the quatity of a lecond: which, with other rafl action, procured him the titte of the Intrepir. But the little profpect he faw of preferment made him renounce the trade of war for the exereife of wit. His comic hiftorics of the lates and empires in the fun and moon, how him well acquainted with the Cartefian phiofophy, and to have a lively imagination. Our Lord Orrery chaffes him with Swift for tis turn of humour, which he fays the latter adopied and purined.

CYRENAIC $A$, an arcient kingdom of Africa, correfponding to the pitfent kingdom and defert of Barea and Tripoli. It was originally irhabital by a number of barbarous mations, diffaing litule fiom great ganss of robbers. Afterwards fome colonics from Greece fettied here, and Cyrenaica became fo powerful a fate, that it waged war with Egypt and Carthage, often with fuccels In the time of 1 ) rius Hyitafpes, Arcefllaus, the reigning piree in Cyrenaica, was diven from the throne: on when his mother Fheretima ap. plied for affitance to the king of Cyprus. Her fon arterwatd rtuming to Da:ca, the ehief city of Cyrene, was there affrnated, together with his father-in law. Pherctima finding herfelf difappointed by the king of Cyprus, applied to Dasins Hy llafocs, and by the affit. snce of the Petfans reduced Barca. Hese the beha. ved with the utmon cruelty, cauling all hofe who had been concenoed in her fon's death to be impaled, and the breal!s of their wiscs to be eut off and affixed near them. She is fard to have been afterwarde devoured by worms; which was locked upon as a ddwine judgment for her exceffive cruelty: The prifoners in the mean time were fent to Daius, who ferald them in a difria of Buctria, fon them called

Barca. Cyrenaica, however, feems to have remained free till the time of Alexander the Great, who conquired it along with Egypt. Soon after his dearh the inhabitants recovered their liberty; but were in a fhort sime reduced by Ptulemy king of Egypt. Under thefe kings it remained till Ptolemy Phyfion made it over to his baftard fon Apian, who in the 658 th year of Rome left it by will to the Romans. The fenate permitted all the cities to be governed by their own laws; and this immediately filled the conntry with tyrants, thofe who were mof potent in every city or difict endeavouring to affume the fovereigraty of it. Thus the kingdom was thrown into great confufion; but Lueullus in a gond meafure reftored the public trauquillity on his coming thither during the firf Mithridatic war. It was found impuffibic, however, totally to fupprefs thefe diturbarces thll the comntry was reduced to the form of a Ruman province, which happencd abont 20 jears after the dea:h of Apian, and 76 before Chill. Upon a revolt, the city of Cyrene was ruined by the Romans; but they afterwards rebuilt it. In procels of time it fell to the Arabs; and then to the Tuhs, who are the prefent makers of it.

CYRENAICS, a fe气 of ancient philofophers, fo called from their founder Atillippus of Cyrene, a difciple of Socrates.

The great principle of their docerine was, that the Supreme good of man in this life is pleafure; whereby they not only meant a privation of pain, and a tranquillity of mind, but an affembluge of all mental and fenfual pleafures, particulally the latt.

Cicero makes frequent mention of Arifippus's fehool; and fpeaks of it as yielding debauchecs. 'Three difcipies of Arikippus, after his death, divided the feet into three branches; under which divition it languithed and funk: the fird ealled the Hegefrac fohool; the fecoml the Annicorian; and the third the Theadoran; from the names of their authors.

CYRENE (anc. geog.), the capital of Cyrenaica, and one of the cities colled Poutasolis, dittant from Apollonia, its fea-port, 10 miles, fituated on a plain, of the form of a table, according to Strabo. A colony of the 'lincans. Though they were defeendants of the Lacedemonians, yet they differed from them in their tum of mind or difpolition, applying themfelves to phalurophy; and hence arofe the Cyrenaic feet, at the head of which was Ariftipus, who placed all happiads in pleafure. 'Ihe Cyreneans were a people much given to anrigation, or the ufe of the chariot, from their excellant breed of horfes, (Pindar, Ephorus, Strabo.)

CYRIL. (St) bithop of Jerufalem, fucceeded Maximus in 350 . He was aftervard depord for the crime of expeling to fale the trealues of the chareh, and applying the money to the fupport of the poor during a groat famine. Under Julian he was reftored to his fee, and was firmly eflatlithed to all his old honours and dignties under Theoderins; in which be contio mued ummefted to his deatli in 386 . The remains. of this father confit only of 23 catechefes, and one letter to the (mperor Contantius.

Cyrall (St) patriach of Alc:andria, fucceeded Theophilus, his uncle, in 412 . Scasce was he inftalled, when he began to excrt his authonity with great vigour ; he drope the Novatians and jews from filex-

Cyren andria, permitting their wealth and fynagogues to be taken from them. This proceeding lighty difpleafed Onftes, the governor of the city, who faw that if the bithop's authority was not foon fuppreffed it minhte grow too thong for that of the magilitate. Upon which a kind of civil war broke out between Orctes and the bithop; many tunolts were taifed, and fone bartles fought in the very flrects of Alczandria. Sit Cyrill affo dettinguibed himet by his zeal againd Neftorius lifflop of Conlantinople, who, in fome of his homilies, had alferted that the Virgin Mary oughe not to be called the mothes of Grod. The difinte at lirth proved unfavourabie to Cyrill, whofe opinion was not only conlemened, but himadedeprised of his bihopric and throwa into pation. But he was foon after releated, aud grained a complete victory over Nctlorius, who in 43 r was depured from his fec of Contantinople. Cyrill veturned to his fee at Conthntinople, where he died in 44 . Si Cyrill alfo wrote againt Theodous of Mupruetta, Diorlorns of Tarfie, and fulian the apoHate. He conpoficd commentaries on St John's gofpet, and wrote feveral other hooks. His works were pulnliftied in Greek and Latin in 163.9 , in fix wolumes fulio.

CYRLS, the fon of Cambyfes the Porian, by Mandane the donghter of Aftyages king of the Medes. The two chief hiftorians, who have written the life of Cyrns, are Eerolotus and Xenophon: but their accounts of him ate different, in as much as the latter makes his father a king of Perfia, and the former a meaner man. The account of Herodotns, as Dr Plideans obfurves, indeed contains narratives that are much more thange and furprifing, and confquently more divering and agrecalle to the reader: and for this reafon more have chofe to follow him than Xenophon.

Herodotus infurms us, that Aftyares king of the Mcdes, drcamed, that a vine fprung from the womb of his daughter Miandane, the branches whercof overfhadowed all Aliz; whereupon having confulted the Eootlifayers, he was told that this dream porteaded the future power and greatnefs of a chitd who hould be bon of his daughter; and firther, that the fame child thould deprive him of his kingdom. Afyages, to prevent the accomplifinent of this prediction, inflead of marrying his daughter to fome powerful prince, gave her to Cambyfes a Perfian of mean condition, and one who had no great capacity for forming any important defign, nor for fupporting the ambition of his fon, by his own riches and anthority. Nor did Aflyages ftop Lere ; the apprehenfions he was under, left Mandane's fon might perhaps find that affiftance in bis own conrage, or forne lucky circumflances which lis family was not able to fupply him with, induced him to take a refolution of difpatching the clild, if there fhould be any. As foon, therefore, as he underfood his daughter was with child, he commanded one of his officers, whofe name was Harpagus, to deAroy the infant as foon as it came into the world. Harpagus, fearing the refentment of Mandane, put the child into the hands of one who was the king's fhepherd, in order to expofe hin. 'The fhepherd's wife was fo extremely tonched with this beauty of Cyrus, that the defired ber Luband rather to expofe her own fon, who was born fume time before, and preferve the young prinee. Af-
ter this manner Cyrus was preferved, and brought up Crus, among the king's thepherds.

One cay, as the meighbouring children were at play torctuct. Cy us was chotenkins; and having punithed one of his litule play-filnws with fome fevelity, for difobeying his com natuds, the child's parent comphaincht of Cyrus to. Alfyages. This princie fant for young Cyrus, and obferving fumething grat in his air, his manner and behavimer, twather whith a gatarefemblance of his danghter Mandane, lue made particular inquiry into the matter, and difcorced that, in reality, Cyrus was no other than his gandfon. Harpagus, ulu was the intrument of preferving him, was sminioed with the death of his own fin: howercr, Altyages beliecing that the roy lly which the fonthayers has! promifed to the young prime wasonly that which he had latuly exereifed among the the pherds children, troubled
 pagus dificlofad the whale feeret of his thirth to him, tagether with the manner wherein he had delivered him from the crucl refolution of his grandfather. He cucouraged him to come into Media, and promifed to furnifh him with firces, in order to make him matfer of the country, and depofe Allyages. Cyrus hearkened to thet propofitions, engaged the Perfians to take arms againft the Medcs, marched at the head of them to meet Aflyates, defeated him, and poffefled himfelf of Media. He carried on many other wars; and at length fat down before Babylon, which after a long fiege lue took.

The relation of Cyrus's life from Xenophon is as follows: Aftyages king of Media married his daugho ter Mandane to Cambyles king of Perfia, fon to Aclixmenes king of the fame nation. Cyrus was born at his father's court, and was edlucated with all the care his birth required. When he was about the age of 12 years, his grandfather Attyages font for him to Media, tngether with his mother Mandane. Some time after, the king of Affyria's fon having invaded Media, Aftyages, with his foa Cyaxares and his grand. fon Cyrus, marched againit him. Cyrus difinguifhed himfelf in this war, and defeated the Affrians. Cambyfes afterwards recalled him, that he might have him near his own perfon; and Afyages dying, his fors Cyaxares, mule by the mother's lide to Cyrus, fucceeded him in the kingdom of Media.

Cyrus, at the age of 30 years, was, by his father Cambyfes, made general of the Perfian troops; and fent at the head of 30,000 men th the affilance of his uncle Cyaxares, whom the king of Baby lon with his allies the Cappadocians, Carians, Phrygians, Cilicians, and Paphlagnnians, were prepating to attatk. Cyaxares and Cyrus prevented them, by falling upon them and difperfing them. Cyrus advanced as far as Bahylon, and fpread terror throughout the country. Frum this expedition he retied to his uncle, towards the fronticrs of Armenia and Affyria, and was received by Cyaxares in the cent of the Alfyrian king whom he had defeated.

After this, Cyruscarricd the war into the countries beyond the river Halys, entered Cappadocia, and lubdued it entirely. From thence lie marehed arainl Crufus king of lydia, beat him in the fult bittle; thea befieged him in Sardis his canhal; and after a

Cyyus fiege of fourteen days obliged him to furrender. See Czoesus. After this, Cyrus having almof reduced all Afia, repaffed the Euphrates, and made war upon the Affyrians. He marched directly to Babylon, took it, and there prepared a palace for his uncle Cyaxares, whether he might retire, if at any time he had an in. elination to come to Babylon; for he was not then in the army. After all thefe expeditions, Cyrus returned to his father and mother into Perfia, where they were fill living; and going fome time after to his uncle Cyaxares into Media, he married his coufin the only daughter and heirefs of all Cyaxares's dominions, and went with her to Babylon, from whence he fent men of the firt rank and quality to govern all the feveral nations which he had conquered. He engaged again in feveral wars, and fubdued all the nations which lie between Syria and the Red Sea. He died at the age of 70 years, after a reign of 30 : but authors differ very much concerning the manner of his death. Herodotus, Jultin, and Valerius Maximus relate, that he died in the war againf the Scythians; and that falling into an ambuth which queen Tomyris had laid for him, he ordered his head to be cut off, and caft into a veffel full of blool, faying, "Thou haft always thirfted after human blood, now glut thy felf with it." Diodorns the Silician fays, that he was taken in an engagement and hanged. Ctefias affures us, that he died of a wound which he received in his thigh : but by Xenophon's account he died peaceably in his bed, amidf lis friends and fervants; and certain it is, that in Alexandtr's time his monument was flown at Pafagarda in Perfia.

From all this, it is cafy to conclude that we are but imperfectly acquanted with the hiftory of this great prince, the founder of the Perfian, and deftroyer of the Chaldean empire. We learn fewer particulars of it from fcripture, but then they are more certain than any that we have produced. Daniel (viii. 3-20.) in the famous vifion wherein God fhowed him the ruin of feveral great empcrors, which were to precede the birth of the Meffah: reprefents Cyrus to us under the idea of "a ram, which had two horns; and the two horns were high, but the one was higher than the other, and the higher came up laft. This ram puhted weftward, and northward, and fouthward, fo that no beafts might fland before hin; ; neither was their any that could deliver out of his hand, but he oid according to his will, and became great." The ram's two horn's fignify the two empires which Cyrus reunited in his perfon; that of the Medes, and that of the Perfians. The latt was greater and more powerful than the empire of the Medes: or otherwife, thefe two horns fignify the two branches of Cyrus's fucceffors. His fon Cambyles dying, the empire was tranfferred to Darius the fon of HyHtafpes, and was continued down to Darius Codomannus, who, as Calmet thinks, is the great horn which the he-goat, tinat denotes Alexander, run dgaintt. In chap sii. 5. Daniel compares Cyrns to a bear, with three ribs in the mouth of it, to which it was faid, "Arife, devour nuch feh." Crus fucceded his father Camburfes in the kingdom of Perfin, and Darims the Medr. by Xenophon called Cyaxares, an : Attyages in the apocryphal chapter (xiii. 1.) of Danicl, in the kingaiom of the Mides and empire of Babylun. He was muarch of $\mathrm{N}^{\mathrm{C}} \mathrm{y}$.
all the Eaft ; or as he fipeaks ( 2 Chr . xxxvi. 22, 23, and Ezr. i. 1. 2) " of all the earth," when he pernitted the Jews to return into their own country, in the year of the world 3466 , before Jefus Chrift 538 . The enemies of the Hebrews, making ufe of this prince's affection to his own religion, prevailed with him to put a flop by his orders to the building of the temple at Jerufalem; (Ezr. iv. 5.) The prophets frequently foretold the coming of Cyrus; and Ifaiah (xliv. 28.) has been fo particular as to declare his name 200 years before he was born. Jofephus (Antiq. I. II. c. 2.) fays, that the Jews of Dabylon fhowed this paffage of the prophet to Cyrus; and that this prince, in the edict which he granted them for their return, acknowledged that he received the empire of the world from the God of Ifrael; and that the fame God had deferibed him by name in the writings of the prophets, and foretold that he fhould build a temple to him at Jerufalem. Cyrus is pointed out in fcripture under the name of the righteous man and the flepherd of Ifrael, (Ifaiah xli. 2. 10. xlvi. 11. and xliv. 28.) Notwithftanding this, God fays of him, (Ifa. xlv. 5.) " I girded thee, though thou hat not known me." And Jeremiah calls Cyrus and his people, who overthrew the Babylonith empire, thieves and robbers. The taking of Babylon by Cyrus is clearly fet down by the prophets, and may be feen under the articles Babylon and Belshazzar. Archbifhop Uther. fixes the birth of Cyrus to the year of the world $3+05$; his firlt year at Babylon to 3466 , and his death to 3475 . The eaftern peopie will have it, that Cyrus by the mother's fide was defcended from fome of the Hebrew prophets; as alfo that his wife was a Jew, which is the reafon (fay they), that this prince fo attached himfelf to the Jews, to whom he was fo nearly allied.

Cyrus II. was the younger fon of Darius Nothus, and the brother of Artaxerxes. He was fent by his fat!er at the age of 16 to affilt the Lacedemonians againit Athens. Artaxerxes fucceeded to the throne at the death of Nothus; and Cyrus, who was of an afpiring foul, attempted to affaffinate him. He was difcovered, and had been punifhed with death, had not his muther Paryfatis faved ham from the hands of the executioner by her tears and intreaties. This circumflance did not in the leaft check the ambition of Cy rus; he was appointed over Lydia and the fea-coalts, where he fecretly fomented rebellion and levied troops under various pretences. At laft he took the field with an army of 100,000 barbarians, and 13,000 Greeks under the command of Clearchus. Artaxerxes met him with 900,000 men near Cunaxa. The battle was luyg and bloody; and Cyrus might have perhaps obtaincel the victory, had not his uncommon rafhnefs proved his ruin. It is faid that the two royal brothers met in perfon, and their engagement ended in the death of Cyrus, 401 years before the Augutan age. Artaxerxes was fo anxious of its being univerfally repurted that his brother had fallen by his hand, that he put to death two of his fubjects for boafting that they had killed Cyrus. The Greeks who were engased in the expedition, obtained ruch glory in the basik: and after the death of Cyras, they remained victonvus in the felc without a commander. They were not difeouraged though at the diftance of above

600 leagues from their comatry, and furrounded on every fide by a powerful cneray. 'ithey manimoully united in the election of commanders, and traverfed all Afia, in ipite of the continual attacks of the Perians; and nothing is more truly celcbrated in ancient hiftory than the bold retreat of the ten thoufand. The journey that they made from the place of their firt embarkation till their return has been calculated at 1555 leagues perforned in the fpace of 15 monthe, including all the time which was devoted to take relt and wefrethment. This retreat keas been cch brated by Xemophom, who was one of their keaders, and among the friends and fupporters of Cyme.
Crist, the beg or tumic including all incyfed tumors, as the feimhen, atherona, fleotoma, maticeres, \&e.

CYSTIC, in anatomy, a nume given to two arteries and two veins.

Cystic duet. See Anatomy, n²g.
CYTHERA, orka, (anc. geor.) diniland oppofite to Mallea a promontory, and to Boice a town of Laconica; with a cornominal town, which has an excollent port called Scandea. The illand was facred to Venas, with a very ancient temple of that godlefs exhibited in armour at Cythera, as in Cypus, Now Cerizo.

CYTHEREA, in mytholugy, the furname of Venus, fo called from Cytherx an ifland, where the had a temple efteemed the molt ancient in Grecee, and on the thores of which fhe was bclieved to be horne by the Zeplyys, furrounded by the Loves, the Tritons, and Ncreides, reelining in a languihing pofture in a feaflell. They give the mame of Cytheriades to the Graces which attended her on the fhore withont quitting her, except on thofe occafions when the rather chofe to be waited on by the Plafures.

CY'TINUS, in botany: A genus of the dodecandria order, belonging to the gynandria clafs of plants; and in the natural method ranking under the 1 ith order, Sarmentacit. The calyx is quauifid, fuperior; there is no corolla ; the antheres are 16 , and feffile; the fruit an octolocular polyfpermons berry.

CYTISUS, tree trbifole: A genus of the decandria order, betonging to the diadelphia elafs of plants ; and in the natural method ranking under the 32 d order, Patilionacta. The caly $x$ is bilabiated, with the upper lip biid ; inferior, tridentate; the legumen attenuated at the bafe. There are In fpecies; of which the moft remarkable are, 1 . The laburnum, or large deciduous cytifus, hath a large upright tree-ftem, branching into a full-fpreading head, 20 or 30 feet high, hasing fmooth greenifh branches, oblong oval entire leaves, growing by threes on long flender footftalks; and from the fides of all the branches numerous yellow fowers collected into long fpikes, hanging loofely downward, and appearing in May. 2. The feffilifolius, often called cypifus ficumblus chyfin, bave a low fhrubby flem duvidia into numeronserect brownith branches, forming a bufly head five or fix feet high, ganifed with fmall oval leaves growing by threes; fome on very fhort foot-ltalls, others fitting clofe; and bright yellow flowers in fhort erect fpikes at the ends of the luanches, appearing in June. 3. The nigricans grows with a mort fhrubby fem, dividing low into many erect flender branches, forming a buhf:

Vol. V. Past II.
 hate leares, and whow howers, terninatiog all the branches in uright firkw, appearing in July. 4. 'R"Le 1 hivfutus, or !uiry eserrcon Nemp bitan cytifus, nfes with an upriglat thrubld, grey them, fonding out many cred greenith hairy branches, forming a fine head fix or eight feet high, clof ly gaminied with fmall hairy trifoliated leaves on fhort foothalks, and yallow Rowers foom the fices of the liranches in thent pemdulous fpikes, appearing in June. 5. The Aultriacus, Anilvian, or Tartaian evergreen eytilus, lah a farmby Hem, dividiug low into many grecnifh branches, forming a buhy hoad three or four feet ligh, having fmooth whitith-green leaves, and bright yelow fowers in clefe umbullitc heads at the ends of the branches, having a clutker of leaves under each head. Thefe fowers appear in May.

Cultrie:, \&ece. All the forts are hardy, and will profper in any common foil and expelure: though, as the lirfutus is fornctimes afteied by fevere frof, it flowld have a dry foil, and a fomewhat fheltered fituation. They may all be propagated by feeds or cuttingz, and all the culture they require in the nurfery is to have the ground kept char from weds, and dag ammally between the rows. Though they are generally con. fidered only as ornamental fhrubs, yet the fritt fpecies, if originally trained to a ftem, and fuffered to fland, will grow to the fize of prity large timber trees. They grow maturally on the Alps, the monntains of Danphine, and the lhighlands of Scotland; and the timber being very hard, and taking a fine pulifh, is frequently ufed for making chairs, tables, bed-theads, and other furniture ; and is faid to equal the finen mahogony in beauty. A fpecies of cytifus, called by linnens cytifus cajim, is known in the Wefl Indies, where it is a native, by the name of the pigeon-pea, from the feeds being the common food of thefe birds in that part of the world. Thefe feeds are alfo fometimes ufed as food for the human fpecies; and as they arc of a very binding quality, afford a wholefome nou: rifhment during the wet feafon, when dyfenteries are fo fiequent.
CYZICENS, CyZICESA, among the ancient Greeks, were a fort of magniticent banqueting-houfes, alway looking towardis the north, and ufvally opening upon gardens.

They had the ir name from $C_{3}$ zicus, a city very confiderable for the grandeur of its buildings; fituated in an illand of My lia, bearing the fame name.

CYZICUN, or Cyzicus (ane. geog.), one of the nobleft cities of the Hither Alia; fituated in a cognominal ifland of the Propontis, on the coall of Myria; joined to the continent by two bridges (Strabo) ; the Jiift by Alexander: the city, a colony of the Milefians (Pliny). Rendercd famous by the fiege of Mithridates, which was taifed by Lucullus. - The inhabitants were made a free people ly the Romans, but forfeited their freedom under Tiberius. It was adorned with a citadel and walls round it ; had a port and marble towers: and three magazines, one for arms, another for warlike engines, and a third for corn. Cyziceni, the people; noted by the ancients for their timidity and efteminacy: hence the proverb in Zenodotus and others, Tinctura $C_{y \text { nisica }}$, applied to perfons guilty of an indecency through fear: but Statires $C_{y}$ 4 M

Czact
thurn,
Czar.
ziceni, nunmi Cyziceni, denote things executed to perfection.

CZACKTHURN, a llrong town of Germany, in Autria, and near the frontiers of Hungay. It is feated between the rivers Drave and Muhir, in E. Long. 17. 19. N. Lat. 46. 24.

CZAR, a title of honour, affumed by the granddukes, or, as they are now ftyled emperors of Ruffia.

The natives pronounce it $t z a r$, or zaar; and this, by corruption (it has been fancied) from Cafar "emperor," from fome imagined relation to the Roman emperors. But this etymology does not feem correct. When the czar Peter formally required of the European courts an acknowledgement of his imperial titles, and that the appellation of Emperor thould never be omitred, there was great difficulty made about it, efpecially at the court of Vienna; which oceafioned him to produce the famous letter, written in the German tongue, from Maximilian I. emperor of Germany, to Vaffili Ivanovitch, confirming a treaty of alliance offenfive and defenfive againtt Sigifmond king of Poland. In this difpatch, which is dated Augult the $4^{t h}, 1514$, and is ratified with the feal of the goldenbull, Maximilian addreffes Vafili by calling him Kaver and Herrfober aller Rufen; "emperor and ruler of all the Ruffias." But independently of this document, there could be no doubt that the foreign courts, in their intercourfe with that of Mofcow, Atyled the fovereigns indiferiminately Great Duke, Czar, and Emperor. With refpect to England in particular, it is certain, that in Chancellor's Account of Ruffia, fo early as the middle of the 16 th century, Ivan Vafiilicvitch II is called Lord and Emperor of all Ru/ia; and in the Englifh difpatches, from the reign of Elizabeth to that of Anne, he is generally addreffed under the fame appellation. When the Europan powers, however, ftyled the tzar Empror of AMflozy, they by no means intended to give him a title fimilar to that which was peculiar to the emperor of Germany; but they beftowed upon him that appellation as upon an Abatic fovereign, in the fame manner as we now fay the emperors of Clina and Japan. When Peter, therefore, determined to affume the title of emperor, he found no difficulty in proving that it had been conferred upon his predeceffors by molt of the

European powers; yet when he was defirous of affis. ing to the term the European fenfe, it was confidered as an innovation, and was productive of more negotiations than would have been requifite for the termination of the moft important flate affair. At the fame time it occafioned a curious controverfy among the learned, concerning the rife and progrefs of the titles by which the monarchs of this country have been diftinguifhed. From their refearches, it appeared thatthe early fovereigns of Ruffia were called great duke, and that Vaffili Jvanovitch was probably the firt who ftyled himfelf $t z a r$, an expreffon which in the Sclavonian language fignines king; and that his fucceflors continued to bear within their own dominions that title as the moft honourable appellation, until Peter the Great firlt took that of Pozelitel or emperor. After many delays and objections, the principal comts of Europe confented, about the jear 1722, to addrefs the fovereign of Ruffia with the title of Emperor; without prejudice, neverthelefs, to the other erowned heads of Europe.

CZASLAU, a town of Bohemia, and capitat of a circle of the tame name. Here is the higheff tower in all Bohemia; and near this place the king of Pruffia gained a victory over the Aultrians in 1742. It is feated on the river Crudenka, in E. Long. 15. 33. N. Lit. 49.50.

CZENSTOKOW, a town of Puland in the palatinate of Cracovia, with a fort, in which they keep a rich treafure, called " the treafure of the virgin Mary." The pilgrims fock hither fo much for the rake of a convent near it, that it is called the Loretto of Poland. The town is fituated on the river in Warte, E. Long. 19. 15 . N. Lat. 5048.

CZERNIC, a town of Carniola, in Auftria, fituated in E. Long. 15. ©. N. Lat. 46. 12. It is remarkable for its lake: for a particular defeription of which fee the article Circhnitzer.

CZERNIKOU, a confiderable town of Mufcovy, and capital of a duchy of the fame name, with a catle. It is feated on the river Dezna, in E. Leng. 32.13. N. Lat. 5 I. 20.

CZONGRODT, a town of Upper Fungary, and capital of a territory of the fame name, at the confluence of the rivers 'Teiffe and Kercs. E. Long. 20. 57. N. Lat. +6.50 .

## D A C

D,THE fourth letter of the alphabet, and the third confonant.
Grammarians generally reckon Damong the lingual letters, as fuppoling the tongue to have the principal fhare in the pronunciation thereof; though the Abbot de Dangeau feems to have reafon in makiug it a palate letter. The letter D is the fourth in the Hebrew, Chaldee, Samaritan, Syriae, Greek, and Latin alphabets; in the five firt of which languages it has the fame name, though fomewhat differently fpoke, e. g. in Hebrew and Chaldee Daleth, in Syriac Doleth, and in Greek Detha.

The form of our D is the fame with that of the Latins, as appears from all the ancient medals and infcriptions; and the Latin D is no other than the Greek $\Delta$, rounded a little, by making it quicker and at two Atrokes. The $\Delta$ of the Greeks, again, is borrowed from the ancient character of the Hebrew Daleth; which form it Atill retains, as is fhown by the Jefuit Souciet, in his Differtation on the Samaritan Medals.

D is alfo a numeral letter, fignifying five bundred; which arifes henee, that, in the Gothic characters, the D is half the M , whicl fignifies a thoufiand. Henee the verfe,

## Litera D velut A quingentos fisnifcabit.

A dath added a-top, $\overline{\mathrm{I}}$, denotes it to ftand for five thouland.

Uled as an abbreviation, it has various fignifications: thus D ftands for D ctor; as, M. D. for Doctor of Medicine; D. T. Ductor of Theol gy ; D. D. implies Doctor of Divinity, or "dono dedit ;" D.D.D. is ufed for "dat, dicat, dedieat ;" and D. D. D. D. for " dignum Deo donum dedit."

DAB, in ichthyolugy, the Englifh name of a fpecies of Pleuronectes.

DABUL, a town of Afia, in the Eaft Indies, on the coait of Malabar, and to the fouth of the gulf of Cambaye, on a navigable river. It was formerly very flourifhirg, but is now naueh decayed. It belongs to the Portuguefe, and its trade confifts principally in pepper and talt E. Long. 73. 55. N. 1.at. 17. 30.
DACCA, a town of Alia, in the kingdom of Bengal in the Eaft Indies, fituated in E. Long. 89. 10. N. Lat. 24.0.-The advantages of the fituation of this place, and the fertility of the fuil round it, have long fince made it the centre of an extenfive conmerce. The courts of Delhi and Muxadavad are furnifhed from thence with the cottons wanted for their own confumption. They each of them maintain an agent on the fpot to fuperintend the manufacture of them; and tee has an authority, independent of the nagiftrate, over the brokers, weavers, embroiderers, and all the workmen whofe bufinefs has any relation to the object of his commiffion. Thefe unhappy people are forbidden, under pecuniary and corporal penalices, to fell, to any perfon whatever, a piece execeding the value of
three guineas: nor ean they, but by dint of money, re. lieve themfelves from this oppreffion.

In this, as in all the other markets, the Europeans treat with the Moorifh brokers fettled upon the fpot, and appointed by the government. They likewife lend their name to the individuals of their own ration, as well as to Indians and Armenians living in their fettlements, who, without this precaution, would infallibly be plundered. The Moors themfelves, in their private tranfactions, fometimes avail themfelves of the fame pretence, that they may pay only two, inftead of five per cent. A diftinction is obferved, in their contracts, between the cottons that are befpoke and thofe which the weaver ventures, in fome places, to manufacture on his own aceount. The length, the number of threads, and the price, of the former are fixed: nothing further than the commiffion for the latter is itipulated, becaufe it is impoffible to enter into the fame detail Thofe nations that make a point of having fine goods, take proper meafures that they may be enabled to advance money to their workmen at the beginning of the year. The weavers, who in general have but little employment at that time, pelform their work with lefs hurry than in the months of October, November, and Deeember, when the demand is preffing.

Some of the cottons are delivered unbleached, and others half-bleaehed. It were to be wihed that this cultom might be altered. It is very common to fee cottons that look very beautiful, go off in the bleaching. Perhaps thie manufacturers and brokers forefee how they will turn out ; but the Europeans have not fo exquifite a touch, nor fuch an experieneed eye to difeern this. It is a circumftance peculiar to India, that cottons, of what kind foever they are, can never be well bleaehed and prepared but in the place where they are manufactured. If they have the misfortune to get damage before they are fhipped for Europe, they mult be fent back to the places from whenee they came.

DACE, in iehthyology, a fpecics of Cyprinus.
This fifh is extremely common in our rivers, and gives the expert angler great diverfion. The dace will bite at any fly; but he is more than ordinarily fond of the flone caddis, or May-fly, which is plentiful in the latter end of April and the whole month of May. Great quantities of thefe may be gathered among the reeds of fedges by the water-fide; and on the hawthorn buthes near the waters. Thefe are a large and handfome bait; but as they laft only a fmall part of the year in feafon, recourfe is to be had to the ant-fly. Of thefe the black ones found in large mole-hills or ant-hills are the beft. Tliefe may be hept alive a lorig time in a bottle, with a little of the eath of the hill, and fome roots of graf; ; and they are in feafon throughout the months of June, July, Augult, and September. The beft feafon of all is when they fwarm, which is in the

Dacea, Dace. Dace.

Dachiw Dacicr.
end of July or beginning of Augulf and they may be kept many months in a veff.l wafhed out with a folution of honey in water, even longer than with the earth and grals-roots in the vial; though that is the moft convenient method with a fmall parcel taken for one day's filhing. In warm weatlier this fith very feldom refufes a fly at the top of the water; but at oiher times he mult have the bait funk to within three inches of the bottom. The winter filling for dace requires a very different hait: this is a white maggot with a reddifh head, which is the produce of the eggs of the beetle, and is turned up with the plough in great abundance. A parcel of thefe put in any veffel, with the earth they were taken in, will keep many months, and are an excellent bait. Small dace may be put into a glafs jar with frelh water; and there preferved alive for a lone time, if the wacer is properly changed. They have been obferved to eat nothing but the animadeula of the water. They will grow very tame be degrees.

DACHAW, a town of Bavaria in Germany. It is pretty large, well built, and feated on a mountain, near the river Amber. Here the elector has a palace and fine gardens. E. Long. II. 30. N. Lat. 4 S. 20.

DACIA (anc. geog.), a country which Trajan, who reduced it to a province, joined to Moena by an admirable bridge. This country lies extended between the Danube and the Carpathian mountains, from the river Tibifcus, quite to the north bend of the Danube; to as to extend thence in a direct line to the mouth of the Danube and to the Euxine; on the north-fide acxt the Carpates, terminated by the river Hierafus, now the Piuth ; on the welt by the Tibifcus or Teifs; comprifing a part of Upper Hungary, all Tranfylvania and Walachia, and a part of Moldavia. Daci, the people; a name which Strabo takea to be the fame with the Dazi of Comedies: neighbours, on the weft, to the Getac; an appellation common alfo in Comedies. Jofephus mentions a fet of religious men among the Daci, whom he calls $P l i f f i$, and compares with the Effeni; of thefe Plifi no other author makes any mention. Dacitus, the epithet; affumed by fome empercrs, (Juvenai.) There was a Dacia Aureliani, a part of lllyricum, which was divided into the eaftern and weftern; Sirmiun being the capital of the latter, and Sardica of the former. But this belongs to the lower age.
1)ACIER (Andrew), born at Caltres in Upper Languedoc, 105 I , had a great genius and inclination fur learning, and ftudied at Saumur under Tannegui ie Fov:e, then engaged in the inftuction of his daughter, who proved afterwards an honour to her fex. This gave rific to that mutual tendernefs which a marriage of 40 gears could never weaken in them. The duke of Muntanfier liearing of his merit, put him in the lift of commentators for the we of the dauphin, ard engaged him in an edition of Pompeius Feftus, which he publifted in 1681. His edition of Horace printed at Paris in 10 vols in 12 mo , and his other works, raifed lim a great reputation. He was made a member of th.e academy of infcriptions in 1695 . When the hiflury of Louis XIV. be medals was finifhed, lie was ehofen to prefent it to his majefty; who being informed of the pains which he had taken in it, fettled upon him a penfion of 2000 livres, and appointed him keep-
er of the books of the king's clofer in the Louvre. When that polt was united to that of library-keeper to the king, he was not only continued in the privileges of his place during life, but the furvivance was granted to his wife, a favour of which there had been no inftance before. But the death of Madam Dacier in 1720, rendered this grant, which was fo honourable to her, ineffectual. He died September 18.1722, of an ulcer in the throat. In his manners, fentiments, and the whole of his conduct, he was a complete mudel of that ancient philufophy of which he was to great an adairer, and which he improved by the rules and principles of Chriftianity.

Dacier (Anne), daughter of Tannegui le Fevre, profeffor of Greek at Saumur in Prance. She early thowed a fine genius, which her father cultivated with great care and fatisfaction. Afrer her father's death fhe went to Paris, whither her fame had already reached ; fhe was then preparing an edition of Callimachus, which the publifhed in 16;4. Haviag fhown fome fhects of it to Mr Huet, preceptor to the dauphin, and to feveral other men of learning at the court, the nork was fo highly admired, that the cuke of Montaufier made a propolal to her of publuting feveral Latin authors for the ule of the dauphin. She rejucted this propofal at firft, as a tafk to which fhe was not equal. But the duke infiled upon it; fo that at lait he rained her confent ; upon which the undertook an edition of Florus, publifhed in 1674 . Her reputation being now fpread over all Europe, Chriltina queen of Sweden ordered count Fonigfmark to make her a compliment in her name: upon which Mademoifelle le Fevre fenr the queen a Latin letter, with her edition of Florus: to which her majefty wrote an obliging anfwer; and not long after fent her another letter, to perfuade her to abandon the Proteftant religion, and made her confiderable offers to fettle at her court. In 1683 fhe married Mr Dacier ; and fion after declared ber delign to the duke of Montanher and the bifnop of Mitaux of reconciling herfelf to the church of Rome, which fhe had entertained for fome time: but as Mr Dacier was not yet convinced of the ratonableneis of fuch a change, they retired io Caltres in 10 b́t, where they had a fmall eftate, in order to examine the points of controverfy between the Proteftants and the Ruman Catholics. They at latt determoned in favour of the latter, and made their public abjuration in 1695 . After this, the king gave both hufband and wife marks of his favour. In 1693 , the applied herfelf to the education of her fon and daughter, who made a prodigious progrefs: the fon died in $16 y 4$, and the daughter became a run in the abbey of Longehamp. She had another daughter, who had united in her all the virtues and accomplifhments that could adorn the fex; but fie died at 18. Her mother has immortalized her memory in the preface to her tranllation of the Iliad. Madam Dacier was in a $v \in r y$ infirm fate of health the two laft years of her life; and died, after a very painful fickneis, Augult 17. 1720, aged 69. She was remarkable for her firmnefs, generofity, equality of temper, and piety.

DACTYL, $d_{d} \sigma_{y} / u s$, a foot in the Latin and Greek poetry, confifting of a long fyllable, followed by two hort ones: as ciz̀mine..

Some fay it is derived from daxiunos, " a finger," becaule

Dacier, Dactyl.

D $\quad$ I
ratyius becaufe it is divided into three joints, the fift of which If is longer than the other two.

The dactyl is faid to have been the invention of Dionyfius or Bacchus, who delivered oracles in this meafure at Delphos, before Apollo. The Greeks call it woxitixne. The dactyl and foondee are the mott conliderable of the poetical feet; as being the nuedfures ufed in hervic verfe, by Homer, Viigil, \&ic. Thefe two are of equal time, but not equal motion. The fpondse has an even, throug, and teady pace, like a trot: the dactyl refembles the nimbler itrokes of a gallop.

Dactrlus was alio a furt of dance arrong the ancient Greeks, chiefly performed, Hefychius obfercts, by the athletie.

Dactyls alfo denote the fruit of the falm-tree, more ufually called dates.

DACTYLI idet; the Fingers of Mount Icia. Conceraing thefe, Pagan theology and fable give very different accounts. The Cretans paid divine worhip to them, as thufe who had nurfed and brought up the god Jupiter; whence it appears, that they wore the fame as the Corybantes and Curetes. Neverthelefs Strabo makes thein different; and fays, that the tradition in Phrygia was, that "Curetes and Corgbantes were defcended from the Dactyli Ideei: that there were originally an hundred men in the illand, who were called Dasyli Itwi; from whom fprang rine Curctes, and each of thefe mine produced ten men, as many as the fingers of a man's two hards; and that this gave the name to the aucettors of the Dactyli Idxi." He relates anotier opinion, which is, that there were but five Dactyli Idex; who, according to Sophocles, were the inventore of irun: that thefe five brothers had five fifters, and that from this number they took the name of furgers of mount Ihlu, becaufe they were in number ten; and that they worked at the foot of this mosntain. Diodorns Siculus reports the matter a little cifferently. He fays "the fitt inhabitants of the illand of Crete were the Dactyli Idxi, who had their refidence on mount Ida: that fome faid they were an hundred; others only five, in number tqual to the fingets of a man's hand, whence they had the name of Darafit that they were maricians, and addicted to myltical cerenonies: that Orphens was their difciple, and carried their myfteries into Greece: that the Dactyli invented the ufe of irom and fire, and that dey had been recompenced with divine honcus."

Diomedes the Grammarian fays, The Dactyli Idui were priefts of the godiefs Cyoele: called Idai, becaufe that goddefs was chiefly worthipped on mount I'da in Phrygia; and Dagyli, beeaufe that, to prevent Satura from hearing the cries of infiant Jepiter, whom C'ybule had committed to their cultody, they ufed to ing curtain verfes of their own invention, in the Dactylic meafure. See Curetes aad Curybintes.

DACTYLIC, fomething that has a relation to dact ll s.

Anciently, there were dactylic as well as fpondaic flutes, tibia dalyficic. The dactylic flutes conlifted of unequal intenvals; as the da@ylic foot does of unequal meafures.
$D_{\text {actrinc }}$ Verfes are hexameter verfes, ending in a dactyl ialtead of a fpondee; as fpondaic verfes are thofe which have a fpondee in the fifth foot inftead of a dactyl.

An inflance of a datiylic verfe we have in Virgil: Dutym. Bisprinice cecilere matus : guin protims ommas bianty

DACTKLIOMANCY, Dactshomantia, a fort
Dadias.
 word is compoled of the Greck daxtunas " ing." of Sxaruxus "finger," and katrue "divination."
Datylionancy contifted principally in holding a ring, fufpended by a tine thread, over a rouad table, on the edge whereof were made divers marks with the twenty four leters of the alphabet. The ring in thaking, or vibrating over the table, thopped over certain of the letters, which, being joined together, connpufed the anfiwer required. But the operation was preceded and acconpanied by feveral fupertitions ecremonics; for firit the ring was to be cemfecrated with a great de: of mythery: the perfon who held it ists to be clad in linen garments to the very fhoes; his lead was to be thaved all round; and in his hand he was to hold vervain. And before he procected on any thing, the gods were lirt to be appaticul by a formulary of pras ers, \&e. Ammianus Marcellinus gives the procefs at huge in his 2gth book.
i) AC'IYLIS, Cock's-root grass: A genus of the digynia order, belonging to the thiandria chafs of plants; aud in the natural method ranking under the $4^{\text {th }}$ order, Gremina. The caly x is bivalued and compretfed, with the one valve longer than the other, cariated, or having the rachis prominent and tharp. There are two [qeecies, the cyrivlutides or fmooth cock's-foot grafo, and tie glomeratus or wugh cork's foot grafs. Both are natives of Ditain: the firf grows in marfhy places, and the latter is comman in ineadows and paturecrounds. 'This latt is ear by hortes, fheep, and goats; but refufed by cows.

DACTYLUS, in zoclogy, a mane given by Pliny to the Prolas.

DADUCEI, in antiquity, priefs of Ceres. That goddefo having loa her daughter Proferpine, fay mythologife, began to make fearch for her at the begiarning of the night. In order to do hivis in the dark. he bighted a torch, and thas fet forth on her tratidy throughout the world : for which reafon it is that the. is alvays feen reprefented with a lighted torch in her hand. On this account, and in conmemoration of this pretended expluit, it became a cutom for the priefs, at the fealts and facrifices of this goddefs, to Lun about in the temple, with torches aftur this manner; one of them took a lighted torch from off the altar, and holding it with his hand, ran with it to a certain part of the temple, where he gave it to another, faying to lim, Tibi trato: this fecond ran after the like mamer to another part of the temple, and gate it to the third, and fo of the reth. From this ceremuny the pritits became denuminated daduchi, $b \times s_{0} \chi^{\prime \prime}$,
 nows wood, as pine, fir, \&c." whereof the ancicut. made torches; and " $x$ ", "I have, I hols." - The Athur nians alfo gave the name deducbus to the highthricit of Hercales.

DXDALA, a mountain and city of Lycia, where Dedalus was buried, according to Pliny.-Alfo two feftivals in Bucotia, fo called; one of them oblerved at Alalcomenos by the Plataans in a large grove, where they expofed in the open air pieces of boiled fteth, and carefully obferved whether the crows that catue to

## D 庆 D

Dxama, prey upon them directed their flight. All the trees Dadalus. + upon which any of thefe birds alighted were immediately cut down, and with them fatues were made,
called D.sualu, in honour of Dedalus. The other feftival was of a more folemn kind. It was celebrated every 60 years by all the citiss of $B x o t i a$, as a compenfation for the intermifion of the fimaller feftivals, for that number of years, during the exile of the Phateans. Fourtecn of the Atatues called Diedala were diftributed by lot among the Platxans, Lebadxans, Coroneans, Orchomenians, T'befpians. Thebans, Tanagreans, and Cheroneans, becaufe they had effected a reconciliation anong the liatieans, and canfed them to be recailed foom exile about the time that Thebes was retured by Caffander the fon of Antipater. 1) uring this feftival a woman in the habit of a bridemaid acconparied a flatuc which was drefed in femaie garments, on the banks of the Eurotes. This proceffion was attended to the top of mount Citheron by many of the Bootians, who had places affigned them by lot. Here an altar of fquare pieces of wood cemented together like flones was erected, and upon it were thrown large quantities of combuttible materials. Afterwaris a bull was facrifced to Jupiter, and an ox or heifer to Juno, by every one of the cities of Boootia, and by the mooll opulent that attended. The poorch citizens offered fmall cattle; and all thefe oblations, together with the Dædala, were thrown into the common heap and fet on fire, and totally reduced to afhes. They originated in this: When Jum, after a quarrel with Jupiter, had retired to Eubce:, and refufed to return to his bed, the god, ansious for her return, went to confult Citheron king of Platea, to find fore effectual meafure to break her obftinaey. Citheron advifed him to drefs a flatue in woman's apparel, and carry it in a charist, and pub. lickly to report it was Platea the daughter of Afopus, whom he was going to marry. The advice was followed; and Juno, informel of her hufond's future marriase, repaired in hafte to meet the chariot, and was eafily united to him. when the difoovered the artful meafures he made dife of to effect a reconciliation.
DEDALUS, an Athenian, fon of Eupalamus, defcended fiom Erechth us king of Athens. He was the molt ingenious artila of his ase; and to him we are indeoted for the invention of the wedge, and many cother mechanical inftruments, and the fails of thips. He male Aaturs which mowed of the mfelves, and feemed to be endowed with life. Talus his filter's fon promifed to be as great as himfelf by the ingenuity of his incentions; and therfore from enve he them him dowa from a vindow and killed him. After the murder of this youth, Dedalus, with his fon Icaus, fied from ithens to Crete, where Minos king of the commery gave him a cordit reception. Dodalus made a famus labrrimh for Minos, and affited Pafiphae the quen, t, gratify her unnatural paffion for a bull. For this action Diedalus incurcd the difpeafure of Mino, who oidered lim to be confored in the labyrinth which he had contrested. Here he made himfiti wings with feathers and wax, and carcfully litted them to his body and that of H is fon, who was the companion of his confinement. They took their flight in the air from Crete; but the heat of the fun melted the wax on the wings of Icrius, whofe fight was too
high, and he fell into that part of the ocean which from him has been called the focrian Sea. The father
by a proper management of his wings alighted at Cumx, where he built a temple to Apollo, and thence directed his courfe to Sieily, where he was kindly received by Cocalus, who reigned over part of the country. He left many monuments of his ingenuity in Sicily, which ftill exifted in the age of Diodorus Siculus. He was difpatched by Cocalus, who was afraid of the power of Minos, who had declared war againit him becaufe he had given an afylum to Dxalalus. The flight of Dedalus from Crete with wings is explained by obferving that he was the inventor of fails, which in his age might pafs at a diftanee for wings. He lived 1400 years before the Chriftian era. There were two
ftatuaries of the fame name; one of Siegon fon of 1400 years before the Chriftian era. There were two
ftatuaries of the fame name; one of Siegon fon of Patroclus; the other a native of Bithynia.

D FMON $\Delta x_{1} \mu \cdot 0$, a name given by the ancients to certain fpirits or genii, which they fay appeared to men, either to do them fervice or to hurt them.

The Greek word sayuav is derived (according to Plato, in his Cratylus, p. 398. ed. Serrani, vol. i.) from Sankev, "knowing or intelligent ;" but according to others from savuxi, "to difribute," (fee the Scholialt on Homer, Il. i. ver. 222). Either of thefe derivations agrees with the offce afcribed to dæmons by the
aneient heathens, as the fpirit intruted with the intions agrees with the office afcribed to dæemons by the
aneient heathens, as the fpirit intruted with the infpection and government of mankind. For, according to the philufophers, dxmons held a middle rank between the celeltial gods and men on earth, and carried on all intercourfe betwen them; conveying the addreffes of men to the gods, and the divine benefits to men. It was the opinion of many, that the celetlial divinitics did not themfelves interpofe in hulethal divinitics did nut themfelves interpofe in huof the grovernment of this lower world to thefe fubaltern deities: Neque eninn pro majefate deunn callfium fue-
rit, bro curare; (Apuleius de deo Socratis, p. 67 ). Cuni-
 ta cue'sfium woluthtute, numine © authoritate, Sel chemonum
 p. 675.) Hence they became the objects of divine worthip. "Ifilluls are nothing." fays Celfus (apud Ori. Fin cont. Cctl. lib. wiii. p. 393.), "what harm can there be to join in the public fellivals? If they are demons, then it is certain that they are gods, in whom we are to contide, and to whom we hould offer facrifices and prayers, to render them propitious."
Severul of the heathen phitofophers hold, that theer were different kinds of dxinons; theat fome of then were finitual fubfances of a more noble origin than the human race, and that others had onee been men.

But thofe dxmons who were the more immediate
objects of the ettablithed wormip amongt the ancient nations were human finte, fuch as were believed to mations were homan Pints, fuch as were believed to their bodics. Phtarch teaches (IVit. Ronnal p. 3 . d. Paris) "that acerafing to a divine mature and jutat. Poris) "that acording to a divine mature and jurank of diemons: and that from dxomons, if they are properly purilicel, they are exalted into gods, not by, properly puriinest, they are exalted into gods, not by, The lame author fays in another place (de If. EOp. p. 351.), "that hisand Ofinis were, for their virtue, changed from good damons into gods, as were Her* clanged from good damons into gods, as were fules

## D E M

Demoniac. cules and Bacchus afterward, receiving the united honours both of gods and demons." Hefiod and wher poets who have recorded the ancient hiltory or traditions on which the public faith and worthip were fotioded, affert, that the men of the goiden age, who were fuppofed to be very gool, became dxmons after death, and difpenfers of good things to mankind.

Though demon is often ufed in a general fenfe as equivalent to a deity; and is acoordingly applied to fate or fortune, or whatever elic was regarded as a god: yet thofe denons who were the more immediate ob. jects of divine worthip amougt the heathens were hillman firits; as is thown in Farmer on Miracles, chap. iii. fect. 2.

The word dimon is ufed indifecently in a good and in a bad fenfe. In the former fenfe, it was wery commonly ufed among the ancient leathens. "We nuit not (fay; Menander) think any demon to be evil, hurfful to a gaod lifc, but cuery gorl to be good." Neverthelefs, thofe are certainly niftakes whe affim, that denon never fignifies an exil being till after the times of Chrift. Pythagoras leld damons who fent difuafes to men and cattle (Diogen. Letert. Fit. Pythagon. p. 514. ct. Amplel.) Zalcicus, in his pieface to lis Laws (aput Stoberun, Scrm. +2.) fuppofes that an evil dremon might be prefont with a mant, to influence him to injutice. The dxmons of Empedods were evil fpirits, and exiles from heaven; (Plutach,
 (p.958) he fays, "It was the opinion of the ancir nts, that evil and mifchicrous dxmons, out of cuvy and hatred to good men, oppole a hatever they do." Sarce did any opinion morestacrally prevail in ancient times than this, viz. that as the diparted fouls of goved men becane grood demons, fo the departed fouls of hatd men became evil ixmons.

It has been generally thought, that thy dienons we are to underftand dovils, in the Septuagint verfion of the Old Tellament. Othersthink the word is in that verfion certainly applied to the ghouts of fuch dead men as the heatlens deified, in Deut. $x \times x$ ii. 57 . Pf. cri. 37. That demon often bears the fame no aning in the New 'Te'pament, and particularly in Acts xvii. 18. I Cor. x. 21. ITim. iv. I. Rev. is. 13, is flown at large by Mr Jofeph Mede (Works, $\mathrm{p} \cdot \mathrm{C}_{2} 3$, at feq.) That the word is applied alwoys to luman fuitits in the New Teftament, Mr Farmer hats attempted to thow iu his Effay on Demoniaca, P. 208, et feq. As to the meaning of the word dymon in the fathers of the Chritian church, it is ufol by them in the fame fenfe as it was by the heathen phitoforlecrs, efpectally the latter Platonils; that is, fometimes for deparus human fipirits, and at other times for fuch fyirits as hed never iuhabited human bocics. In the fathers, indeed, the word is more commonly taken in an cwil fenfe, than in the ancient philoforphers Befides the two forementioned kinds of demons, the fathers, as we 11 as the ancient philofophers, held a third, giz. Fuch at fpang from the congrefs of fuperior heings with the daughties of men. In the theoldyy of the faihers, thele wase the worit kind of damons.

Differcnt orders of dxmons had lifferche fations and emporsments afligned them by the ancients. Cood denans were confulered as the anthous uf gaul to mankind; evil dxmons brought innuneralle wils both
upon men and beafs. Amongt evil dxmons there Dxmoniace. was a great diflintion with refpect to the offees af. figned them; fonc complled neen to wickednels, others Rimulatul them to madnefs See Demonac.

Much has been faid concerming the demen of Socrates. 1He pretended to his friends and difciples, and even declarcal to the world, that a fricudly fpirit, whom he called his demm, dicetud him how to act on every inpurtum uccafion in has life, and retenned him from impradence of combat.
In contemplating the chatater of this great phitofopher, white we admite him as the nothe pattern of virtue and moral wildom that appearel in the heathen world, we are naturally led te inguire, whoticr what he gave ont comecrning his devano wh: a trick of imponture, or the reverie of ahoated imatarim, or a fober and true account of a idvoler which helven defand to confer on fo extraurdinary a man.

Tou afeertain in this cafe the ubject of our inquirice, is by no means to eafy as the iuperficial thinker may be apt to imagime. When we confider the dignity of fentiment and timplicity of manners which Socrates difplayed throush the general tenor of his life, we cannot sadily bring ourfelves to think that lae could be capable of tuch a a rick of impulture. No. thing of the wildnefs of an enthafiat appears in his character: the modefts of his prete vions, and the reppect which in his converfation and conduct he uniformiy rentified for the ordinary duties of fo.ial life, fuficienty prove that he was free from the influcnee of bind enthufiafin: we cannot infer, therefore, that, like the attronmer in Rafles, he was deceived with refect th his demon by an overheatel imagination. It is no lefi dificult to believe, that God would diftinguith an heathen in fo eminent a manner, and yot lean hima uninferncted in the principles of true religion. Surely, if ever fiepticifin be ralonable, it mult be in fuch maters as the prefent.
let, if it the hill infitted, that fome nue of thefe thece notions concerning the demon of Socrates mult be more probible than the others; we would rather chem soucrates an conthufad in this inflance, than degrate him to the bafe character of an impottor, or rappofe that a firitual being a tually revealed himFelf to the philofopher, and condefcended to become his conntont attemant and connicllor. People are often noder the influme of an over-heated imagination with regerd to fome one thing, and cool and fuber as to cerrs thing elfe.
DKMORILC (frum demon), a human being whofe nef. volition and wher montal faculties are overpowered and reftainced, anl his body poffered and actuated, by fone cacated fipintual being of ruperior power.
Such fens to be the determinate icule of the word; phpute $^{2}$ but it is difinted whether my of mankind cuer wercenserning: in ric menfunate comition.
It is generaily agrect, that neither good nor cril acs. fpicis ire kurna to cecrt fuch authority at prefent uver the human race: bat in the ancient heathea wold, and among the Jews, particularly in the days of one Savinur, evil farits, at hean, are thought by many whave been more tronblefume.
"The Greeks and Romans inagimel, that the ir dei- Nothmens
 the prophet or prophewis whe was confulted, ove: "ide chang

Anmon aroced their faculties, and utered giponfes with - ilacir organs of peecil. Apollo was belicved to enter is to the Prabuef, and to dietate the propletic anfiwers received by thofe who confaltud her. Other omales befides that of Delphi were fuppofed to unfold fumity by the fame maninery. ind in varous wher cafes, either malignant damons or benevolent daities were thought to enter into and to adacte huran beings. The lymot hatich the Gerrith, the Laveati, of the Romans, were all of this deferption; and the Grects, by the ufe of the word sanke.t5, they refered to this caule the erigin of madnds. Amner the ament heathens, thenfore, it appers to lave bech a denerally rectived opinion, that luperor binge enterd oceafimally into inen, overpowered the faculties of their minds, and actuated their bodily organs. They might imagine that this happened in infances in which the filts were owing to the operation of diferent eaules; but an oriaion to gencrally prevalent had furely fore phaulthe foudation.

The Jews too, if we may trutt the faced writings or Jof phus, apptar to have believed in damoniacal polffion. The cafe of Saul may be recollected as one amonis many in which fuperior created beings were bedeved by the Jows to exot in this manner their influence over human life. The general tenor of their hiftory and hasuage, and their doctrines concerning grod and evil firitis, preve the opinion of $d x$ moniacal poffefion to have been well known and generally received among them.
Ofmankut In the days of our Saviour, it would appear that in general damoniacal noffeffon was very frequert annong the in the days Jews and the neighbouring nations. Nary wire the of our sa. wicur. evil fpirits whom Jfus is related in the gufpels to have ejected from patients that were browght unto him as poffefed and tormented by thofe malevolent dermons. His apofles too, and the firt Chiftians, who were mott active and fucceffful in the propagation of Chriftianity, appear to have often exceted the miraculous powers with which they were endowed on tinilar occalions. The damons difplayed a degtee of knowledge and malevolence which futriciently ditinguifned them from human beings: and the language in whilh the dxmoniacs are mentioned, and the aetions and fentiments aferibed to them in the New Teftament, how that our Saviour and his apoftes did not confider the idea of demoniacal poffeffion as being merely a vulgar error concerning the origin of a difeafe or difeafes produced by natural caufes.

Jefus
ihrin an!
lis apontice munt have believed deemeria. cal foffer. fion to be tesh.

The more enlightened cannot always avoid the ufe of netaphorieal modes of exprcfion; which though founded upon error, yet have been fo ettablifhed in language by the influence of cullom, that they cannot be fuddenly difmiffed. When we read in the book of Jofh:a, that the fun on a certain occation food ftill, to thlow that hero time to complete a vithory; we eafly find an exeufe for the conduct of the facred hiftorian, in accommodating his narrative to the popular ideas of the Jeas concerning the relative motions of the heavenly bedies. In all fimilar inftances, we do not complain much of the ule of a fingle phrare, origirally intruduced by the prevalenee of fome groundlefs cpinion, the fallity of whiel is well knowa to the witer.

But in defcriptions of characters, in the narration of $\mathrm{No}^{\mathrm{N}} 9 \mathrm{O}$
facts, and in the laying down of fyitems of doarine, Dumonis we require different rules to be obferred. Should any $\underbrace{\text { Duman }}$ perfon, in compliance with popular opinions, talk in terious language of the cxiftence, difpofitions, declarations, and actions of a race of beings whors he knew to be abiolutely fibulous, we furely could not praife him for candid integrity: we mult fuppofe him to be cither caulting in irony over the weak credulity of thote around hum, or taking advantage of their weaknets, with the diftonefty and the felfith views of an impolior. And if he himilf fhould pretend to any connection with this imaginary fyttem of beings; and thould claim, in confquence of his connection with then, puticular honours from his coatemporaries: whatever inight be the dignity of his character in all other refpects, nobody coald hefitate even for a mo. ment to brand him as an impoltor of the bafett character.
Precifely in this light muft we regard the conduct of our saviour and his apotles, if the idea of dremoniacal poffetion were to be confidered merely as a vulgar error. They taiked and acted as if they believed that evil fpirits had afually entered into thofe who were brought to them as poffeffed with devils, and as if thofe fpirits were actually expelled by their anthority out of the unhappy perfons whom they had pofictid. They expected, they demanded too, to have their profetions and declarations belicere, in confequence of their performing fich mighty works, and to be honoured as having thus triumpled over the powers of hetl. The reality of damoniacal poffefion flands upon the fame evidenee with the goffel iyttem in general.
Neither is there any thing abfurd or unreafonable in this dochine. It does not appear to contradiet thofe ideas which the general appearances of nature and the feries of events fuggelt concerming the benevolence and widom of the Deity, and the counfls by which he regulates the affairs of the univerfe. We often fancy ourfelves able to comprehend things to which orr undertanding is wholly inadequate : we perfiwade ourfues, at times, that the whole extent of the works of the Deity mult be well known to us, and that his defigns mull always be fuch as we can fathom. We are then ready, whenever any difficulty arifes to us, in confidering the conduct of Providence, to model things according to our own ideas; to deny that the Deity ean poffibly be the author of things which we cannot reconcile; and to affert, that he muit aet on every oecafion in a manner confiltent with our narrow views. This is the pride of reafon; and it feems to have fuggetled the firongeft objections that have been at any time urged againft the reality of demoniacal pofteifoon. But the Deity may furely connect one order of liis ereatures with another. We perceive mutual relations and a beautiful conneßion to prevail through all that part of nature which falls within the fphere of our ouffervation. The inferior animals are connected with mankind, and fubjected to their authority, not only in inftances in which it is exerted for their adrantage, but even where it is tyrannically abufed to their deftruction. Among the evils to which mankind have been fubjected, why might not their being liable to dxmoniacal poffetion be one? While the Supreme Being retains the fovereignty of the uniselfe,

Denoniac. univerfe, he may employ whatever agents he thinks proper in the exceution of his purpofes: he may either commifition an angel or let loofe a devil; as well as bend the human will, or communicate any particular impulfe to matter.

All that revelation makes known, all that human reafon can conjecture, concerning the exiltence of various orders of fpiritual beings, good and bad, is perfectly confutent with, and even favourable to, the doctrine of dxmoniacal poffeffion. It was generally believed through the ancient heathen world; it was equally well known to the Jews, and equally refpected by them; it is mentioned in the New Teftament in fuch language, and fueh narratives are related concerning it, that the gofpels cannot well be regarded in any other light than as pieces of impolture, and Jefus Chrift mult be confidered as a man who difhoneftly took advantage of the weaknefs and ignorance of his contemporaries, if this doctrine be mothing but a vulgar error ; it teaches nothing inconfitent with the general conduct of Providence; it is not the caution of philofophr, but the pride of reafon, that fuggefts objections
his adverfaries, Thefe are not the wurds of Bim that bath Demoniae a demon; meaning, no donbt, that hefpoke in a more rational manner than a madman could be expented to fucak. The Jews appear to have aferibed to the infuence of dremons, not only that fpecies of madnefs in which the patient is raving and furious, but alfo melan:holy mad. nels. Of John, who fechaded himelf from intercoute with the world, and was diftingitifed for abotinence and acts of mortification, they faid, He lenth a demon. The gouth, whofe father applied to Jufus to fire him from an evil fpirit, deferibing his unhappy condition in thefe worls, Have mary on my fon, for be is lumatis and fore wexed auith a damon; for oft times be follesh into the fore, and oft into the water, was plainly epilpotic. levery thing indeed that is related in the Now Tretla. ment conceming drmoniaco, proves that they were people affected with fuch natural difeafes is are fat from being uncommon among mankind in the prefent age. When the fymptoms of the diforders cured by our Saviour and his apotles as cafes of dxmoniacal poffeflon, comefpond fo exactly with thofe of difeafes well known as natural in the prefent age, it would be abfurd to impute them to a fupernatural canfe. It is much more confiltent with common fenfe and found philofophy to fuppofe, that our Saviour and his apottles wifely, and with that condefenfion to the weak. nefs and prejudices of thofe with whom they converfed, which fo eminently diftinguifhed the eharacter of the Author of our holy religion, and muft always be a prominent feature in the character of the true Chilitian, adopted the vulgar language in fpeaking of thofe unfo:tunate perfons who were groundlefsly imacrined to be poffefed with dxmons, though they well knew the notions which had given rife to fuch modes of $\epsilon \mathrm{x}$ preflion to be ill-founded, than to magine that difeafes, which arife at prefent from natural caufes, were produced in days of old by the intervention of d.emons, or that evil fpirits fill continue to enter into mankind in all eafes of madnefs, melancholy, or epilepfy.

Befides, it is by no means a fufficient reafon for receiving any doctrine as true, that it has beengentally reccived through the world. Error, like an efidanical difeafe, is commmicated from one to another. In certain circumftances, too, the influence of inarination predominates, and reftrains the exations of reafon. Many falle opinions have extended their influence through a very wide circle, and maintained it long. On every fuch occalien as the prefent, therefore, it becomes us winquire, not fo mach how generally any opinion has been seceised, or how long ir has prevailed, as from what caufes it has originated, and on what evidenee it retls.

When we contemplate the fiame of nature, we lece hold a grand and beautiful fimpricity presailing thos the whole : Notwillatancing its immenfe cextot, and loffe: thongh it contains fach numberkef divelfies of beina: lant the
 does not difplay affer fimplicitr, on an haphitr onnec- ${ }^{\text {Hatu. }}$. tion of parts. We may theafore vobture to daw an inference, by analogy, from what is obferathe of the order of nature in general to the prefent cafe. "'o permit sill firits to intermeddle with the corcors of humas life, would be to beak though that onder which the Dhisy appears to hase efabifinaed etronter lies 4 N worke;

Denmoniace works; it would be to introduce a degree of confuU1: fion unworthy of the witiom of Divine Providence.
Duble.
Such are the mot rational arguments that have been urged on toth fuldes in this controverfy. Pethaps the demonianins have the fronger probabilities on their fite; bre we will not prefume to take upon ourflyes the office of arbitrators in the difpute
D EMONIACS, ia church-hiftory, a branch of the Ambaptills: whofe diftinguifing tenet is, that the devils fhall be faved at the end of the world.
Jaffolil. See Narcissus.
DAGNO, a town of Turky in Europe, in Albania, with a bihops fece. It is the capital of the diftrict of Ducayini, and is feated on the rivers Drino and Nero, near their confuence. It is 15 miles fouth-eaft of Scutari, and $1 ;$ northeat of Alcfio. E. Long. 19: $4^{\text {s. }}$ N. Lat. 42.0.
1)AGO, of Dagho, an ifland in the Baltic Sca, on the conf of Livonia, between the gulf of Finland and Riga. It is of a triangular figure, and may be about $2=$ miles in circumference. It bas nothing conIiderable but two cattles, called Dugrer-wort and Paden. E. Long. 22. 30. N. Lat. 5\%. $4^{8 .}$

- Secr $S_{a m .}$ DAGON, the falfe god of Afhdod *, or, as the chap. v. Greeks call it, Azotus. He is eommonly reprefented as a montter, half man and half tifli; whence mot learned men derive his mame from the Hebrev dar, which figuifies "a fid." Thofe who make him to have been the inventor nibraderor, derive his name from the Hebrew- Dagza, which lignifies frumatuon: whence Philo Bithius callis him Lus $\mathrm{A}_{5} \times 1$ ant, Fupier Aratrius.

This deity continued to have a temple at Aflod during all the ages of idolatry to the time of the Maccabees: for the author of the firt book of Maccabees rells us, that "Junathan, one of the Maccabees, having beaten the army of Apollonius, 1emetrius's general, they fled to Azotus, and entered into Bethdagon (the temple of their idul) ; but that Jonathan fet fire to Azutus, and burnt the temple of Dagon and all thofe who were fled into it."

Daron, according to fome, was the fame with Jufiter, according to others Saturn, according to others Venus, and according to molt Neptune.

DAFGESTAN, a country of ilia, bounded by Cireafia on the north, by the Cafpian Sea on the calt, Ey Chirvein a province of Perfia on the fouth, and by Georgia on the weft. Its chief towns are Tarku and Dubent, both fituated on the Cafpian Sea.
DAHOMiE, a kingdon of Africa, on the coat of Guimea, to the noth of Whidah, or Fida. The king of this comiry conquered Whidah, and very much difturbed the ilave-trade of the Erropeans.

DAILLE (juhn), a Protellant miniter near Paris, was one of the mof learned diviass of the ith century, and was the moft eftemed by the Catholics of all the cuntroverfial writers among the Protellants. He was tutor to two of the grandfons of the illiflrious Mr Du Flefio Mornai. Mr Daille having lived it years with foexcellent a mafter, traveiled into Italy with his two pupils : one of them cicd abroad; with the other he faw Italy, Switzerland, Cermany, Flanders, Helland, and England, and returned in 1621. He was reccived minifter in $162_{3}$, and firt excreifed his offee in the family of Mr Du Pleflig Mornai ; but
this did not laft long, for that lord died foon after. The memoirs of this great man eniployed Mr Dille the following year. In 1625 he was appointed minifter of the ehurch of Samur, and in 1626 removed to Paris. He fpent all the relt of his life in the fervice of this laft church, and compoied feveral works. His firft piece was his matterpiece, an̂d an excellent work, Of the Ufe of the Fathers, printed 163 . It is a ftrong chain of reafoning, which forms a moral demontration againlt thofe who would have religions difputes decided by the authority of the fathers. He died in 1670 , aged 77.

DAIRI, or Datro, in the hillory of Japan, is the Guvereiga pontiff of the Japanefe; or, according to Kxnuper, the hereditary ecclefiaftical monarch of Japau. In eflect, the empire of Japan is at prefent under two fovereigns, viz. an ecelefintical one called the dairo, and a fecular one who bears the title of kabo. The lat is the emperor, and the former the oracle of the religion of the country.

DAIRY, in rural affairs, a place appropriated for the manayment of milk, aud the making of butter, checfe, \&ic. Sce Mutter, Cheese, Evc.

The dairy-houfe thould alway, be kept in the neatert order, and fo fituated as that the windows or lattices never from the fouth, fouth-eall, or fouth-weth. Lattices are alfo to be preferred to windows, as they admit a more fiee circulation of the air than glazed lights polibly can do. It has been objected, that they admit cold air in winter and the fun in fummer; but the remedy is eafly obtained, by making a frame the fize of or fomewhat larger than the lattice, and conttructing it fo as to llide backward and forward at pleamure. Pdekthrad frained acrofs this frame, and oiled cap paper pafted therem, will admit the light, and keep out the fun and wind.

It is hardly poffible in the fummer to keep a dairyo houfe too cool; on which account none should be fituated far from a good fpring or cument of water. They thould be neatly pased either with red brick or fmooth lard llone; and laid with a proper defeent, fo that no water may lodge. This pasement fhould be well walhed in the fummer every day, and all the utenfils belonging to the dairy fhould be kept perfectly clean. Nor thould we ever fuffer the churns to be fcalded in the dairy, as the fleam that arifes fron hot water will injure the milk. Nor thould checfe be kept therein, nor rennet for making cheefe, nor a cheefe-prefs be fixed in a dairy, as the whey and curd will diffufe their acidity throughout the room.

The proper receptacles for milk are earthen pans, or wooden vats or trundtes; but none of thefe Chould be lined with lead, as that mineral certainly contains a poifonous quality, and may in fome degree affect the milk: but if people are fo obltinate as to perint in whing them, they fhonld never forget to feald them, fcrub them weil with fait and water, and to dry them thoroughly, before they depofite the milk therein. Indeed all the utenfils thould be cleaned in like manner befure they are ufed; and if after this they in the leaft degree fmell four, they mult undergo a fecond fcrubbing before they are fit for ufe.

DAKIR, in our flatuics, is ufed for the twentieth part of a lalt of hides. According to the fatute of

51 INen. III. De contpofitione fondicup © menfurarum, a laft of hides confifts of twenty dakirs, and every dakir of ten lides. But by 1 Jac . eap. 33 . one laft of hides or Rins is twetre dozen. See Dicker.
1)A1S, in botany: A genus of the monogynia order, belonging to the decandria clafs of plants; and in the natmal method ranking under the 3 itt order, $V$ eprectha. The involucrum is tetraphyllous; the corolha quadritid or quinquefid; the fruit a monofpermous berry.
balsy. See Bellis.
1)ALACA, an ifland of the Red Sca, over-againft the eorat of Abex, about 72 miles in leagth and 15 in breadth. It is very fertile, populons, wnd remarkable for a pearl filliery. The inhabitants are negrocs, and great eneaties to the Mahometans. There is a town of the fame name feated over-againit Abafia.
1)ALBERGIA, in botany; a genus of the oftandria order, belonging to the diadelphia elafs of plants. There are two filaments or Itamina quadrifid at top. The fruit is peclicellated, not gaping, leguminous, membrano-comprefied, and bearing feeds.

DALEA, it province of Sweden, bounded on the morth by Dalecarlia, on the calt by the Wermeland and the lake Wener, on the fonth by Golhand, and on the north by Norway aad the fea.

DALEBURG, a town of Sweden, and capital of the province of Dalia, feated on the weitern bank of the lake Wener, 50 miles north of Gottenburg. E. Long. 13. O. N. Lat. 59. o.

DALECARELA, a province of Sweden, fo called from a river of the fame name, on which it lies, near Norway. It is divided into three parts, which they call solleys; and is about 175 miles in length and 100 in breadith. It is full of mountains, which abound in mines of copper and iron. fome of which are of a prodigions depth. The tomens are very fmall, and ldra is the eapital. Tlue inlabitants are rough, rubut, and warlike; and all the great revolutions in Sweden had their rife in this province. The river rifes in the Dofxine mountains : and, running fouth.calt thro' the provinee, falls into the gulph of Buthia.

DALECHAMP (Janes), a phylician in Normandy, in the 16 th eentury, wrote a Hitcory of Plants, and was well fkilled in polite learniag. He wrote notes on Pliny's Natural Hitury, and tranflated Athenxus into Latin. He practifed phyfic at lyons from 1552 to $155^{\circ}$, when hed ed, aged 75 .

DALECHAMPLA, in botmy: A genus of the adelphia order, belonging to the monercia clafs of plants: and in the natural method rankine under the 3 Sth onder, Tricoicc. The involucrum of the male is common and quadripartite ; the calyces hesaphylluns; conclia nune; the nectarimm laminated or faly; the ftamina munolelphous or coalited at the hale, and polyandons or numerous. 'The femake involucrum is common and triplyyllous; corolla none; dyle one; the eapfule tricoceons.- 'There is but onte fpecies, aiz. the fcandens, a native of Jamaica. It is a climbing plant, which rifesto a confiderable height ; and is remarh.able for nothing but having its leaves arneed with brift$i_{y}$ hairs, which thing the hands of thoie who unwarily tonch them.

DALLM, a town of the United Provinces, and capital of a dillict of the fame name. It was taken by
the French in 1672, who demolithed the fortifications. De itar. It is feated on the river bervine, five miles morth-eat of Liege LE. Lomg. 5. 59. N. Lat. 50. 10.

D'ALEMBER'I'. S'e Alambert.

DALEN (Cornclias Van), an cminent engraver, who fonmithed about the year soiqo. He was a mative of Holland; but under what madter he keaned the art of engraving, is uncertain. It is diffoult in form a proper judgmeat of his merit; for fometimes his printo refembte thofe of Cometius Vifeher, of Lacas Voilerman, of P. Pontins, of Bolfwert, and other maters. A fer of antique ttatues, engraved by him, ate ins bold, free alyle, as if founded upon that of (Goltaius; others, again, feem imizations of that of Francis Poilly. la all thefe different maners he has fieceecded; and they plainly manifel the great command he had with his graver, for he worked with that inhtument only. He engrived a great varicty of portraits, fome of which are very valuable, and form the belt as well as the larger past of his works.

DALKEl'TH, a town of Scotland, in Mid-Lothim, fix miles louth-calt of Ediaburgh; W. Long. 2. 20. N. Lat. $55 \cdot 50$. It is the prineipal retidence of the Duke of Buedengh, who has here a noble hone and cxtentive parks. In this houle, which at the time was the lead-quarters of Gencral Monk, the reltoration of Charles II. was planmed. - The Duke's eldelt fon has the tith of Eall of Dalkeith. Here is a confiderable market weclily on Thurfdays, which fupplies in part both Ediubargh and Clafgow.

DALMA'LA, a province of Europe, bounded on the north by Bofnia, on the fonth by the gulph of Ve. nice, on the eall by Servia, and on the welt by Irlorn lachia. Spalato is the capitas of that part beionging to the Venctians; and Raguza, of a republic of that name; the lurks have a thind, whofe capital is Her\%c. govina. The air is whulefone, and the loil fruitlul; and it abounds in wine, corm, and oll.

DALIUN, a town of Lancafhire, in Enghand. It is feated on the fpring-head of a river, in a champaign comatry, not far from the fea; and the ancient callle is made ufe uf to keep the records, and prifoners for. debt in the laberty of lurnes. W. Long. 3. O. N. Lat. 54. is.

Dalron (John), D. D. an eminent divine and poet, was the fon of the Kov . Mr John Daltun rector of Dean near Whitehaven in Cumberland, where he was buru in $170 \%$. He was educated at Queen's College, Oxford; and bicame tutor or governor to the Lord Beauchamp, only fon of the Eand of Hertford, late Duke of somerfet; duming which time he adaped Milton's admirable Matk of Comus to the ftage, by a judicious infertion of fueral fongs and diferent palfages felected from other of Milton's works, as well as of feveral fongs and other elegant additions of his own, fuited to the characters and to the mamer of the original author. Durmg the run of this picce he induftrioully fonght out a grand-daughter of Milton's, oppref. fed both by age and poverty; and procured her a lonetit from it, the prolits of which amounted to a very conlidemble fum. He was prontoted by the king to a prebend of Worcetter; where he died un the 22d of July 1763. Belides the above, he wrote a deferiptive pocm, addeffed to two ladies at theit retumf from view$4 \mathrm{~N}_{2}$

Dam ing the coal-mines near Whitehaven; and Remarks on
12 hiforical defiens of Raphact, and the Mufeum Gracum Er Egyptiac:m.

DAM, a boundary or confinement, as to dam up or adan out. Infra damum, funm, within the bounds or limits of his am property or juridietion.

DAMA, in zoulogy: See Crrvus.
DAMAGE, in law, is gtnerally underftood of a burt or hindrance attending a perfon's eftate: but, in common law, it is part of what the jurors are to inquire of in giving verdict for the phantifi or defendant in a civilaction, whether real or perfonal; for after giving verdict on the principal caufe, they are likewife anked their confciences touching cotts and damages, which contain the hindrances that one party hath fuffered from the wrong done him by the other. See Costs.

DAMAN, a maritime town of the Ean Indies, at the entrance into the gulph of Cambay. It is divided by the river Daman into two parts; one of which is called Neav Daman, and is a handfome town, well fortified, and defended by a good Purtuguefe garrifon. The other is called Old Daman, and is very ill built. There is a harbour between the two towns, defended by a fort. It was taken by the Portuguefe in 1535 . The mogul has attempted to get poffeflion of it feveral times, but always without effict. E. Long. 72. 35. N. Lat. 21.5 .

DAMASCENUS (John), an illuftrious father of the church in the sth century, born at Damafcus, where his father, though a Chrittian, erjoyed the office of counfellor of ttate to the Saracen caliph; to which the fon fueceeded. He retired afterwards to the monaftery of St Sabas, and fpent the remainder of his life in writing books of divinity. His works have been often printed: but the Paris edition in 1712,2 vols folio, is ettecmed the belt.

DAMASCIUS, a celcbrated ieathen philofopher, born at Damafcus in the year 540, when the Goths reigned in Italy. He wrote the life of his matter II dorus; and dedicated it to Theodora, a very learned and phlofophical hady, who had alfo been a pupil to Ifidorus. In this life, which was copiouly written, he $\mathrm{f}_{1}$ quently made oblique attacks on the Chriftian religion. We have nothing remaining of it but fome exrracts preferved by Photius. Damafcius fucceeded Theon in the rhetorical fchool, and Ifidorus in that of philofophy, at Athens.

DAMASCUS, a very ancient city of Syria in Afra, feated in E. Long. 47. 18. N. Lat. 35.0. Some of the ancients fuppofe this city to have been built by nate Damafcus, from whom it took its name: but the molt generally received opinion is, that it was founded by Ura the eldell fon of Aram. It is certain, from Gen. xiv. 5 . that it was in being in Abraham's tisme, and confequently may be looked upon as one of the moft ancient cities in the world. In the time of king David it feems to have been a very confiderable place; as the facred hiflorian tells us, that the Syrians of Damafous fent 20,000 men to the relief of Hadadezer king of Zobah. We are not informed whether at that time it was governed by kings, or was a republie. Afterwards, however, it becane a monarchy which prored very troublefome to the kingdom of Ifrach, and would even have deftroyed it entirely, had not the Deity mairaculualy interpoted in its behalf. At latt this
monarchy was deftroyed by Tiglath Pilefer king of Damarcus, Affyria, and Damafcus was never afterwards governed Damatia. by its own kings. From the Affyrians and Babylonians it paffed to the Perfians, and fiom them to the Greeks under Alexander the Great. After his death it belonged, with the reit of Syria, to the Stleucidx ; till their empire was fubdued by the Romans, about 70 years be. fore Chilt. From them it was taken by the Saracens in 633 ; and it is now in the hands of the Turks. Notwithftanding the tyranny of the Turkih government, Damafcus is ftill a confiderable place. It is fituated in a plain of fo great extent, that one can but jult difeern the mountains which compafs it on the other fide. It ftands on the weft fide of the plain, about two miles from the head of the river Barrady, which waters it. It is of a long, Itrait figure, extending about two miles in length, adorned with mofques and ftecples, and encompaffed with gardens computed to be full 30 miles round. The river Barrady, as foon as it ifluessfrom the clefts of the Antilibanus into the plain, is divided into three Atreams, whereof the middlemoft and biggett runs directly to Damafeus, and is diftrituted to all the cilterns and fountains of the city. The other two feem to be artificial; and are drawn round, one to the right, and the other to the left, on the borders of the gardens, into which they are let hy little currents, and difperfed every where. The houfes of the city, whofe Atreets are very narrow, ate all buile on the outide either with fun-burnt brick, or Flemin wall: and yet it is no uncommon thing to fee the gates and doors adorned with marble portals, carved and inlaid with great beauty and varity ; and within thefe portals to find large fquare courts beautified with fragrant trees and marble fourtains, and compaffed round with fplendid apartments. In thefe apartment; the ceilings are ufually richly painted and gilded; and their duans, which are a fort of low ftages feated in the pleafanteft part of the room, and elevated about 16 os is inches above the floor, whereon the Turks eat, fleep, fay their prayers, ixe. are floored, and adorned on the fides with varity of marbic mixed in mofaic knots and mazes, fpread with carpets, and furnihed all round with boliters and cufhions, to the resy height of luxury. In this city are flown the clurch of John the Baptit, now converted into a famous mofque; the houfe of Ananias, which is only a fmall grotto or cellar wherein is nothing remarkable; and the houfe of Judas with whom Paul lodged. In this laft is an old tomb, fuppofed to be that of Ananias; which tha Furks hold in fuch veneration, that they keep a lamp continually burning over it. There is a cafle belonging to Damafcus, which is like a little town, having its own Areets and houfes; and in this cafte a maga. zine of the famous Damafcus teel was formerly kept. The fruit-tree called the damafoene, and the flower caited the duma/k rofe, were tranfplanted from the gardens belonging to this city; and the filks and linens known by the name of damighs, were probably invented by the inharitants.

Dimarcers Sted. See Damask.
DAMASIA (anc. geog.), a town of Vindelicia on the Licus. Afterwards called Auguffa. Now Augsburg in Suabia, on the Lech. E. Long. 10. 50. N. Lat. 48.20.

DAMASK, a fort of filken fluff, having fome parts
mifed above the ground, repreienting flowers or other Ggures. Damafk fhould be of dreffed tilks, both in warp and woof. It has its name from its being originally brought from Damafens in Syria.
There is alfo a fuff in France called the cafuet dawafl, made in imitation of the true damaff, having woof of hair, coaric filk, thread, wool, or cotton. Some have the warp of lilk and the wouf of thread; others are all thread or all wool.
Damask is alio a kind of wrought linen, madc in Flanders, fo called, becaule its large flowers refemble thofe of damafis. It is chicfly ufed for tables; a table-cloth and a duzen of napkins are called a da-ma/fe-fervice.
Damask is alfo applied to a very fine itcel, in fome parts of the Levant, chiefly at Damafcus in Syria; whence its name. It is ufed for fivord and cutalas blades, and is finely tempered.

DAMASKELNING, or Damasking, the art or operation of beautifying iron, fteel, \&c. by making incifions thercin, and filling them up with gold or filver wire ; chietly ufed for adorning fword-blades, guards and gripes, locks of pithls, \&c.
Damakkening partakes of the mofaic, of engraving, and of carving: like the mofaic, it has inlaid work; like engraving, it cuts the metal, reprefenting divers figures ; and, as in chaling, gold and tilver is wrought in relieso. There are two ways of damafing : the one, which is the finef, is when the metal is cut deep with proper initruments, and inlaid with gold and filver wire : the other is fuperticial only.
DAMELOPRE, a kind of bilander, ufed in Holland for conveying merchandife from onc camal to another; being yery commodious for paffing under the bridges.
DAMIANISTS, in church-hitory, a branch of the ancient acephali-feverite. They agreed with the - catholics in admitting the VIth council, but difowned any dillinction of perfons in the Godhead; and profelfed one lingle nature, incapable of any difference: yet they called God "the Father, Son, and Holy Gloft."
DAMIETTA, a port-town of Egypt, fituated on the ealfern mouth of the river Nile, four miles from the fea, and 100 milts north of Grand Cairo. E. Long. 32. and N. Lat. 31. The prefent town itands upon a different fite from the ancient Damietta fo repeatedly attacked by the Eurepean princes. The latter, according to Abulfedr, was a "town furrounded by walls, and fituated at the mouth of the eaftern branch of the Nile." Siephen of Byzantium informs us, that it was called Thumiatis under the government of the Greeks of the lower empire, but that it was then very inconfiderable. It increafed in importance every day, in proportion as Pclufium, which was frequently plundered, loft its power. The tutal ruin of that anciert town occationed the commerce of the eaftern parts of the Delta to be transferred to Demietta. It was, however, ro longer a place of itrength, when, towards the year 238 of the Hegina, the em. perors of Conitantinople took pofieffion of it a fecond time. The importance of a harbour fo favomably fituated opened the eyes of the caliph. In the ycar $24 t$ of the Hegira, Elmetouakkel furrounded it withatrons
walls. This obftacle did not prevent Roger king of Damicta. Sicity fronn tukion it from the Mahometans in the year - , 550 of the Hegira. He did not, however, long enjoy his conqueit. Salab Eddin, who about that period mounted the throne of Esypt, expetled the Luropeans from Damitta. Fifteen yeara aftet they returned to befiege it; but this able fultan balled all their efforts. Notwithtanding their land army was fupponted by a flet of 1200 fail, they were obliged to make a difgraceful retreat.
It was the fate of this place to be conflantly beficged. In the year 615 of the Hegira, under the reign of Eladel, the crufaders attacked it with a very conliderable force. They landed on the weflera thore of the Nile ; and their firfteare was to farround their camp with a ditch and pallifddo. The month of the river was defended by two towers, furnified with numerous garifons. An enomous iron chain, flretching from one fide to the other, hindered the approach of voflets. The crufders carried by form the tower on the fame fide with their camp, boke the chain, and opened the entrance of the river for their ileet. Nejm. Eddin, the fultan's fon, who was encamped near Damietta, covered it with an army. 'ro top the enemies veffels be threw a bridge over the Nile. The Franks overturned it, and the piince adopted the meafure of choking up the month of the river, which be almolt rendered impalifle by feveral largo boats he funk there. After alternate and various fucceffs, many bloody battes, and a fiege of 17 months, the Chriftian princes took Damietta by florm. They did not, however, long enjoy the frait of fo much blood fyilt, and of an arnament whicl had coit inmenfe fums. Completely invelted near the canal of Achmonn, by the waters of the Nile and by the Egyptian army, they purchafed their lives and their libetty by the facrifice of their conqueit.

One-and-thirty years after this defest Sc Louis carried Damietta without ttriking a ltroke. The Arabs, however, foon recovered it; but tired of keeping a place which continually drew upon them the molt warlike nations of Lurope, they totally deflroyed it, and rebuilt it further up in the country. This modern Damietta, firth called Menchi:, as Abulfeda tells us, has prcferved the memory of its origin in a fquare full called by that name. Whiters in general have confounded thefe two towns, afuibing to the one the attributes of the other. The moden Damietta is runded in a femicircle on the ealtern bank of the Nile, two leagues and a half from the mouth of it. The eye, placed at one of the ex. tremities of the crefcent, takes in its whole extent. It is reckoned to contain 80,000 fouls. It has feveral fquares, the molt conliderable of which thas retaned the name of Minnis. The bazars are filled with merclants. Spaciuss okuls, on khans, colletiing under their porticos the fluts of India, the filks of mount Ietbanom, fal-ammoniac, and pyramids of rice, pro. claim that it is a comnercial town. The houfes, thore in particular which are on the banks of the river, are very lofty. 'They have in general handume taloons buik on the top of their terraces, which are cleerful beividers, upen to every wind, where the Turk, effismisetely reclining on a fopha, pafto his life in fmo-
hing
1.nivett. kinc, in looking on the fea, which bounds the hori-

Lem20:1 on one fide, on the great lake that extends it felf nul the other, and on the Nile, which, running between them, trayerfes a rich country. Several large mofquez, adoned with lofty minarets, are difperied over the town. The public baths, lined wich marble, are dittributed in the lane manner as thofe of Grand Cairo. The linen you are ferved with is clean, and the water very pure. The heat and the treatment in them, fo far from injuring the health, ferve to Atrengthen, nay even to improve it, if ufed with moderation. 'This cuftom, founded on experience, is gencral in Egypt.

The port of Damietta is continually filled with a multitude of boats and fimall veffels. Thofe called Sharm ferve to convey the nerchandize on board the hips in the road, and to unload them; the others carry on the coafting trade. This town carries on a great trade with Syria, with Cyprus, and Marleilles. The rice called Meraclaovi, of the finelt quality there is in Egypt, is cultivated in the netghbouring plains. The exports of it amount annually to about fix millions of livres. 'The other articles of the produce of the country are linens, fal-ammoniac, corn, \&c. A ruinous policy for the country prohitits the exportation of this lalt article ; but the law is evaded, and it paffes under the name of rice.

The Chriftians of Aleppo and Damafcus, fettled in this town, have for feveral ages carried on its $\mu$ rincipal commerce. Turkifh indolence, content with extorting from them from time to time, fuffers them to become rich. The exportation of rice to foreign conntries is prohibited; but by means of fome duactirs to the cuftomhoufe officers, the people of l'rovence load annually feveral haips with it. The Boraz preventing them from entering the Nile, their cargoes are conveyed on board by the boats of the country. This inconvenience is the fource of endlefs vexation and abufcs. The boat, which is loaded in the evening with rice of the fuft quality, is frequently not that which arrives at the fhip; an inferior quality is fubfituted for it curing the night. The Marfeilles captains, aware of there rogueries, without being able to prevent them, endeavour to play off tick againit trick, fo that this commerce has become a general fcene of knavery. But the badnefs of the port is fill more detrimental to Damietta. The road where the veffels le being expofed to every wind, the night. It gale obliges the captains to cut their cables and take Chelter at Cyprus, or to ftand off to fea. It would be cafy, by cutting a cana? only of half a league, to open a paffage for Chips into the Nile, where there is deep water. This work, which might be executed at very little expence, would reader Demietta a noble hatbour; but defpotifm, inSentable to the interdl of the people, is always fursounded by defruction in its progrels, and wants both the will and the power to create.

The tongue of land on which Damietta is fituated, ftraitened on one fide by the river, and on the other by the weftern cxtremicy or take Menaale, is only from two to nid miles wide frum eaft to weft. It is interfectec by innumerable riwulets in every direction, which render it the moft fertle fpot in Egypi. The foil there produces, comaminius annis, So bumbls of rice for
one. 'The other produce is in the fame proportion. Daniet It is these that nature, lavihing profuftly her pomp Damocic and riches, prefents flowers, fruits, and harvelts, at every featon of the year. Winter never deprives it of thete advantages; its beauties are never impaired by fummer. Dethuctive heats, as well as chilling cold 3 , are equally unknown in that happy fpot. The thermometer varies only from 9 to 24 degrees above the freezing point. Damietta is indebted for this charming temperature to the immenfe quantity of water with which it is furrounded. The fordure is no where fo freth; the trees are no where covered with luch quantitics of fruit. The rivilets around the fields of rice are lined with feveral kinds of reeds, fome of which rife to a great height. The reed calamus is here found in abundance, which is made ufe of for writing by the olientals. Its dender falk bears long narrow leaves, which hang gracefully, and fpreading branches covered with white Howers. Here allo are to be feen forefts of papyrus, of u hich the ancient Egyptians made their faper. Strabo, who calls it Billus, gives an accurate dodeription of it. It is here alfo that the Lotus, of which the Arabs have preferved the primitive name of Nuplar, exalts its lofty falk: above the waters. Its large caly $x$ blows either of an azure blue or of a brihiant white, and it appears with the majelty of the king of the aquatic plants. The marmes and the canals in the interior parts of the country are filled with this luperb hower, which diffufes a molt agreeable odour.

There are a great many villages around Damietta, in moll of which are manufactures where the mod beautitul linens of the country are fabricaied. The finctit napkins in particular are made there, fringed with filk. You are ferved at table with them, but efpecially on curemonial vilits, when the flave prefents you with one to wipe your mouth wich, after you have drank your therbet, or eat the fwertmeats, which are carried round on a hilver plate to all the company. Thefe finall towns, generally furrounded with litcle woeds, or trees promifuouly planted, form a whimfical and picturtique aflemblage. By the lide of the fycamore and the melanchcly tamanud, one fees the e!cgant cafia tree, with its clulters of ychlow flowers, like thofe of the cyilias. The top of the date-tree, loaded with enormans bunches, rifes above the grove. The caflia, with its fweet-fcented fower, grows under its hade. The orange and lenon trecs cover the habouren's cabin with their golden fruit. The bananatree with its long leaves, the pomegranate with its fenlet Dowet, and the fig-tree wihh its fugaty fruit. throw a vall variety into thele landicapes.

DAMN11, anciently a people of Britain; fituated between the Sclgovee to the fuath and the Caledunii to the north. Now Citdedale.

DAMNONII. Sée İAnmonir.
D.AMOCLES, one of the fatterers of Dionyfius the Eider of Sicily. He admired the tyrant's wratth, and pronounced him the happielt man on earth. Diony fius prevailed upon him to undertake for a while the charge of royalty, and be convinced of the happineis which a foverenga enjoyed. Damocles afcended the throne, and whic he gazed upon the wealih and fplemdor ila: furruubded him, he perceived a fword hang-

## D A M

 he begred Dionyfus to remove him from a fituation which ex: fed his life to fach fears and dingers.DAMON, the mame of feveral illutrious ancients; particyl'rly of a Pythagorean plitofopher very intimate with Pythias. When he had been condemned to death by Diony inis, he obtained from the tyrant leave to po ard fettle his domeftic affairs, on pronife of returning at a frated hour to the place of execution. Pyethias pledged liomfulf to undergo the punifhment which was to be iuficted on Damon, fhoild he not return in time, and he confcquently delivered himfulf into the hands of the tyrant. Damon returned at the app , inted monemt, and Dionyfius was fo ftruck with the fidelity of thofe two friends, that he remitted the punifhment, and int cated theth to permit hims to flaze their triendfaip and cuijy their confidence.

DAMPIER (Wilhiam), a famous navigator, dcfeended from a good family in Somerfethise in Fagland, was born in 1652 . Lofing his father when very yound, he was fent to the fea, where he foon dillinguilhed himfelf, particularly in the South Sea. His voyage round the world is well known, and has gone through many editions. He appears afterward to have engaged in an expedition concerted by the merchants of Britul to the South Sea, commanded by Caftain Woods Rogers; who failed in Augul r-08, and returned in September r71t: but we have no further particulars of his life or death.

DAMIPS, in natural hitory (from the Saxon word dant, fignifying vapour or exhalation), are certain noxinus exhalations iffuing from fome parts of the earth, and which prove almoft inflantly fatal to thofe who breathe them.

Thefe damps are chiefly obferved in mines and coalpits: though vapours of the fame kind often iffue from old lavas of burning mountains; and, in thofe countries where voleanoes are common, will frequently enter houfes, and kill people fuddenly without the leaf warning of their approach. In mines and coal-pits they are chiefly of two kinds, called by the miners and colliers the choke and fire dames; and both go under one general nane of feul air. The choke damp is very much of the nat ure of fixed air ; and ufnally infents thofe places which have been formerly worked, hut long neglected, and are known to the miners by the name of waffes. No place, however, can be reckoned fafe from this kind of damps, except where there is a due circulation of air; and the procuring of this is the only proper means of preventing accidents from damps of all kinds. The choke-damp fuffocates the miners fuddenly, with all the appearances found in thole that are fuffocated by fuscd air. lleing heavy, it defcends towards the lowelt parts of the workings, and thus is dangerous to the ininers, who can fearce avoid breathing it. The fire-daint, which fecms chictly to be compofed of inflammable air, lifes to the roof of the workings, as being fpecifically lighter than the common atmoiphere; and hence, though it will fuffocate as well ats the other, it feldom proves fo dangerous in this way as by its inflammable property, by which it often takes fire at the candles, and explodes with extreme viulence.

In the Phil. Tranf. $n^{\circ}$ rig. these is in account of
fome explofions by damps of this kind, on which we have the following obfervations. I. 'Thofe who are in the place where the vapour is fired, foddenty find themfelves furrounded with flames, bit liear little or no noife; though thofe who are in places adjacent, or above ground, hear a very great onc: 2. "Thofe who are furrounded by the inflamed vanour feel themflyes foorched or burnt, but are not movel nut of their places, though fuch as unhappily thand in the way of it are commonly killed by the violence of tha thock, and often thrown with great force cut at hae mouth of the pit ; nor are the heavieft machines found able to refill the impetuolity of the blat. 3. Nu fneil is perecived before the fire, but a very ftrons one of brimitone is afterwards felt. 4. The vapour lics towards the corf, and is not perceived if the candles ane held low ; but when thefe are held higher, the damp defonds Jike a black mift, and catches hold of the flane, kengethemins it to two or three handfuls; and this appearame cerafes whon the eandles are hed nearer the ground. 5. The flame continues in the vant for feveral minutes after the cract:. 6. Its colour is blue, fomething inclining to green, and very bright. 7. On the explosion of the vapour, a dark fmoke like that proceeding from fired gunpowder is perceived. 8. Damps are generally obferved to come ahont the latter end of May, and to continue during the heat of fummer. They return feveral times during the fummer feafon, but obferve no certain rule.
l Belides thefe kinds of damps, which are very common, we find others deferibed in the Philofophical 'Iranfactions, concerning the mature of which we can fay nothing. Indeed the account fuems fomewhat fufpicious. They are given if M Mr Jefon, from whom we have the foregoing obferrations concerning the firedamp, and who had thefe from the miners in Derbythire. After defcribing the common damp, which confits of fised air, "They call the fecond fort (fars he) the paffe-bloon damp, becaufe, as the $y$ fay, it fmells like peali-bloom. Theoy tell me it always comes in the fummer-time; and thofe grooves are not free which are never troubled with any other fort of damps. I never heand that it was maral; the lecnt, perhans, frceing them from the danger of a furprife: but by reafon of it many good gronve lie idle at the beft and molt profitable time of the vear, when the fubterrant ous waters are the lowett. 'They funcy it procceds from the multitnde of red-trefoil foveers, by them called he neyfuckles, with which the limentone madows in the Peake do much abound. Whe that is the flanetand note peftential of any; if all be true which is faid concerning it. Thofe who pretems to have feen it for it is vifible) deterihe it thas: In the hirgeft gart of the noof of thofe paffages which branch out from the main groove, they often fee a romad thins hunging, about the bignefs of a foot-ball, covered with a fation of the thicknefs and colour of a cob-weh. This, they fay, if it is broke by any acoident, as the fplinter of a thone, or the like, difperfeth irfelf immediately, and fuffocats all the company. Therefore: to provent cafulties ar. foon as they have efpicel it, they have a way, by the lectp of a tack and lons rope, of beating it at a di flance; which done, they purify the mace well with lise, before they dare enter it agria. I dare not a.

## D A M $\quad\left[\begin{array}{lll}656 & ] & \text { D A M }\end{array}\right.$

Fomps. vouch the truth of this fory in all its circumftances, becaufe the proof of it feems impoffible, fince they fay it kills all that are likely to bear witnefs to the particulars: neither dare I deny but fuch a thing may have been feen hanging on the roof, fince I have heard many affirm it."-Some damps, feemingly of the fame sature with thofe laft mentioned, are noticed by the auther of the Chemical Dictionary, under the word Damps. "Amonglt the noxious mineral exhatations (fays he), we may place thofe which are found in the mines of Sal-gem in Poland. Thefe frequently appear in form of light hoeks, threads, and fiders webs. 'They are remarkable for their property of fuddenly catching fire at the lamps of the miners with a terrible noife and explofion. They infantly kill thofe whom they touch. Similar vapours are found in fome mines of foffil coal."

With regard to the formation of damps we have as yet no certain theory : nor, though the experiments of aerologitts are abundantly able to how the compofition and manner of forming thefe noxious airs artificially, have they yet thrown much light on the method by which nature prepares them on a large fcate. There are two general ways in which we may fuppofe this to be done; one by the fagnation of atmofpheni. ral air in old wafte places of mines and coal-pits, and its converfon into there mephitic exhalations; the other by their original formation from the phlogitic or other materials found in the earth, without any interference of the atmofphere. In favour of the former opinion it may be urged, that old waites are newer free from damps, efpecially thofe of the kind refembling fixed air; nor are they always defecient in the inflammable kind. The fame is alfo true of old veills, or even cellars, and in thort in every place where the air ftagnates for any confiderable time. But, on the other hand, we have many indlances of fixed air coming out of the earth, and that in valt quantities, where no confiderable ftagration of the atmofphere could be fufpected; as for inftance, in the grotto del Cani in Italy, where a continual ftream of it has iffued from time immemorial. The fame feems to be the cafe with the tops of fome high mountains, particularly Mont Blane, the highelt in Europe; on the top of which M. Sauffure found the atmofphere fo much impregnated with fixed air, that lime-water expofed to it very quickly gathered a crult on its furface Sir William Hamiton, in his account of the eruptions of Vefuvius, informs us, that the inhabitants in the neighbourhood of that mountain ase infetted with a kind of peftilential vapours named by them mofetes, which iffine from the old lavas thrown out by the volcano. Thefe are of the nature of the damps in our mines or coal-pits, and iffue forth in fuch quant ty as either to infect the atmofphere for a very condiderable way round, or to do mifchief by being carried from place to place by the atmofpherical currents, which are not frong enourh to diffipate the n for fome time. Fion fome late accounts, the famici (or foorching winds, as they have been reprefented) in the eaftern courties, feem to be no other than ftreams of fixed air of confiderable cxtent, which exert their ufual and fatal effects on thone who breathe them. A frong arcument in fayour of this opinion is, that the fe winds $\mathrm{N}^{\circ} 87$.
cannot crofs a river, it being the nature of water to abforb fixed air, and thus dettroy them.

Hence it is rendered probatle that thefe mephitic vapours are oftern to be met with in the open atmofphere, and confequently cannot always be the effect of ftagnation; nor indeed does it at all appear that mere flagnation can affect the quality of the atmofphere either one way or other. This fluid cannot have its properties altered but by fomething immerfed in it upon which it can act, and by means of which action its component parts may be changed or feparated. White this procefs is going on, there is generally, if not always, an abforftion of air, acconpanied indeed frequently with an emiffion of sonse aerial fluid equal in quantity to that which is abforbed. Mr Scheele, in his Miffay on Fire, has hlown by a nunber of experiments the effect of expofing eertain fubitances to the action of air, both on the fubftances them. felves and on the aerial fluid. The refult of all thefe is no other than what we might expect from a very flow combullion, and which perhaps may on inquiry be found to be the only way by which air can be decompofed. If the fubitance expofed to the air was capable of abforbing that part of the fluid which had undergone a change, there was always an evident diminution, but not otherwife Thus, on inclofing fome caurtic fixed alkali in a phial of atmofpheric air, a confiderable diminution took place ; and the alkali, by becoming faturated with fixed air, fhowed that a decompolition had taken place, and that the dephlogilticated part of the air had feparated from the other, attached itfelf to the fixed alkali, and become fixed air by uniting with a certain proportion of phlogitic matter. Hence we may conceive, that in any place where the air was contined over a valt quantity of cautic alkaline falt, it would foon become unfit for the purpofes of animal lofe, and we might fay that a damp would be formed. But this would be a damp of a very different kind from that ufually met with in mines; for here the dephlogifticated part of the atmofphere beinc converted into fixed air, and abforbed by the falt, only the poifonous mephitic, or as it is commonly called phlocificiatid, air would remain, fo that no insed air could ever be feparated from it.

Let us now fuppofe, that inftead of the alkaline falt a quantity of burning charcoal is conficed in a place where there is not a proper circuation of air, and we will foon fee that a damp of the very fame kind with that called by uniners the choke-damp will be formed. But this, according to the late difo cuveries, takes piace by reafon of the diffipation of the charcoal by heat, and its union with the dephlogifticated part of the atmofphere, which always conditutes fixed air *. In this cafe, however, the damp e See Ael muff be but of fhort continuance, and will foon be logy and diffipated after the charcoal is extinguifhed; but if, in- Fixed Ai ftead of the clareoal, we fubflitute a large yuantity of fermenting liquor, from whence the fixed air is naturally emitted, a damp will be formed puuch more difficult to be diffipated than the former, becaufe it renews itfelf in a very fhort time; and, unlefs there is a very conflant circulation of air, it will be dangerous to enter the place where it is

From the laft example we may form an idea of the manner

## D A M $\left[\begin{array}{ll}6 j\end{array}\right] \quad D A_{1} \mathrm{H}$

Samps. manner in which thefe damps, confiting chichy of fixed air, are formed. We know not indeed thororgh. ly the nature of fermentation; but we are affured, that it is always accompanied by an internal hear: which, in fome cafes, is ruifed to the utmoit height, infomuch that large quantities of moill vegetable fub. itances, packed together, wili fornetimes burt out into flame. It is not, howeser, at all times neceffary for the extrication of fixed air, that the heat hould come to this extremity. 'Ithe example of fermenting liquors nows, that in fome cafes a very moderate heat is fufficient for the purpofe. Now, though the comparifon may feem fomewhist inadequate between the folid fubllance of the earth and a fermenting liquid, $y$ ct we know that a gentle heat condantly takes place in the bowels of the earth; and that almolt all tercettrial fubltances will enit fised air on being expofed to heat. It is not at all insprobable, therefure, that, on the large feale of nature, the quantity of materials may compenfate for the weaknefo of the leat, and thus occation a conftant emiffon of fixed air ; which, though now in comparifon of what is effected in our experiments by a violent artificial heat, may yet accumulate in the narrow fraces of mines in fuch a manner as to be very troublefome. In volcanic countries, where the heat of the earth is much greater, the cmiffion of fixed air is in proportion ; atad thus we may account for that continual firean of it, which iffues from the grotto del Cani, and perhaps other places. The mojites, which are faid to proceed from old lavas, can only be accounter for by fuppofing the heat, which originally took place in them, to be in fome meafure renewed; or that they have been again, by fome means or other, difpofed to take fire as formerly: 1. : this we offer merely as al conjecture ; there nut being as get fufficient data to determine any thing pofitively upon the fubjed.

It may be objected to the hypotheris juft now laid down, that, if there is a continual difpofition in the earth to produce fixed air, the whole furface of it mult pour out fuch a quantity as would deftrcy every living creature upon it. This indeed might be granted, were the furface of the earth quite bare, and deftitute of vegetation : but we know that fixed air is compofed of the dephlogiticated kind and phlogiton; and that thife two ingredients, äfter being once joincd, may be feparated from each other, and reaffume their proper characters. 'There is no abfurdity, therefore, in fuppofing that the fixed air may be contimually decompofed by the vagotables which grow all over the furface of the earth; and the atmofphere not unly thas preferved from any taint from it, but fupplied with a quantity of pure dephlogiticated air, which it is certain that vegetables do emit. It is allo certain, that wherever the atmofphere is fuffered to be in contact with the base furface of the ground for fome time, a confiderable quantity of fixed air will be produced, unlefs there is a conflant circulation of atmofpherical air to carry off the former before it has time to produce any fenlible effect. Hence we may account for the damps in wells, cellars, and even in the confined places of old eafles and ruinous buildings, where the air is not in contact with the furface of the ground itfelf, but with mere heaps of rubbifh and old walls.

Vol. V. Part II.

With regard to wist is called the fre bumb, the cate fceres to be mare plain. In the phil. Tinne no this lind which feened evidently to iffuc from tie earth. "This wort is upon a coal of five yards in thicktefs, and hati been tregen upon about fio: o: eight and thirty years ago. When it was firl fumb, it was extremeiy full of water, fo that it could not be wrought down to the bottom of the eonl; but a wist-hets or cave, was driven out of the middle o! it, upoz a lcvel, for gaining room to work, and diawing down the frring of water that lice in the coal to the eye of the pit. In driving of which witchet, after they had gors a confiderable way under ground, and were fanted uf wind, the fire-damps did begin by little and little to breed, and to appear in crecices and flits of the coal. where water had lain before the opening of the coal. with a fmall bluilh fame, working and noving cont:nually; but not out of its fint feat, unlefs the work. men held their canedes to it ; and then being wak: the blaze of the candle would drive it with a fudden fizz away to another crevice, where it would foon af ter appear blazing and moving as formerly. 'This wese the firft knowledge of it in this work, which the work men made but a fport of ; and fo partly neglected, till it had gotten fome ftrengtl ; and then upon a morning: the firft collier that went down, going forwards in the witchet with his candle in his hand, the damp prefently darted out fo violently at his candle, that it flruciz the man clear down, finged all his hair and clothes, and dilabled him from working for a while after. Some other fmall warnings it gave them, informuch that they refolved to employ a man on purpofe that was more reColute than the reft, to go down a while before thent every morning, to chafe it from place to place, and fu to weaken it. His ufual manner was to put on the wouf rags lie had, and to wet them all in water, and when he came within the danger of it, then he fell down groveling upen his belly, and fo went forward, holding in one hand a long wand or pole, at the head whereof he tied candles burning, and reached them by degrees towards it ; then the damp would fly at them, and, if it miffed of putting them out, would quench it. felf with a blatt, and leave an ill-fcented fmoke behind. Thus they dealt with it till they had wrought the coal down to the hottom, and the water following, and not remaining as before in the body of it , among fulphureous and brafly metal that is in fome veins of the coal, the firc-damp was not feen nor heard of till the latter end of the year 1675 , which happened as followeth.
"After long working of this coal, it was found upon the rifing grounds that there lay another roach of coal at the deptly of 14 yards under it, which proved to be $3^{\frac{1}{2}}$ yards thick, and fomething inore fulpharous. 'This encouraged vs to fink in one of the pits we hac formenly ufed on the five-yards coal.-As weefurk tiar lower part of it, we had many appearances of the faredamp in the watery erevices of the rocks vee funts through, flathing and dartiag from fide to fule or the pit, and fhowing rainhow-like culours up on the furface of the water in the bottom; but upon drawing up of the water with buckets, which Airred the air in tre pits, it would leave burning, till the colliers at work, witls their beenth and fiveat, and the fmoke of their candles.

4 () thacicuct.

## D A M [ 658 ] D A M

Samps. thickened the air in the pit, and then it would appear again; they lighted their candles at it formetimes when they went out; and fo in this pit it did no further harnı."

In another pit, however, it foon appeared, and at laft produced a moft terrible explotion. This was oecafioned by one of the workmen going imprudently down with a lighted candle, after a ceffation of work for fome days, and the force cxerted by it feemed equal to that of gun-powder.

The formation of inflamnable air in mines cannot be attributed to any vitiation of the atmofphere; for there is no natural procefs with which we are acquainted, by which fuch a change could be aecomplifled. In one inftance, however, we have an example of a fire-damp being produced, not osly without any confiderable ftagnation of atmofpherical air, but where there is the beft circulation imaginable. This $i_{3}$ in large bellows ufed in metallurgic works, which are fometines burit by an explofion of infammable matter proceeding from the rancid matters with which the leather is greafed. Dr Priefley has fhown, that inflammable air is compofed of pure elementary fire, chareoal or phlogiton, and a little water; and that this compofition may take place even in vacuo. All thefe materials are to be met with in the bowels of the earth. Coal, a bituminuus fublance, is abundantly ablc to fupply the phlogition; the natural moifture of the earth affords water, and the heat, however gentle, which confantly exilts in the bowels of the earth, may be fufficient to produce a quantity of inflammable air, which gradually accumulating in thofe places where there is not a conftant Aream of atmofpherical air to carry it off, will foon produce the dreadful eifects already mentioned.

A much more important confideration than the formation of damps, however, is the propes method of avoiding their pernicious effetts. The inflammability of one kind affords an eafy method of preventing it from accumulating, viz. by fetting fire to it. This may be done with fafety, unlefs it has been fuffered to go too far before the experiment is made: for the inflammable air, being much lighter than any other kiad, will naturally rife to the top; fo that a man, ly. ing flat on the ground to avoid the force of the ex. plofion, and holding up a lighted candle fixed upon a pole, may at once free the mine from fuch a troublefeme gueit. Put wherc it has been allowed to accumulate in too great quantity, fo that this method cannot be ufed, or in the other kind, which is not inflammalle, the method commonly practifed is to produee a conllant cireulation of air as nuch as poffible through all parts of the mine. 'To procure this, they make a perpendicular opening, which they call a /hemk or flafi, fo that the mine may have two or more openings; and thus by reafon of the difierence of temperature between the open atmofphere and that in the mine, there is a continual draught of air through them both. This current will always be ftronger in proportion to the difference between the external atmofphere and that of the mine; and likewife in proportion to the difference between the depth of the two Shafts. But as the temperature of the atmofphere is variable, it liappens, at certain fuafons of the year, that there is not a fufficient differnce between that
of the atmofphere and in the mine to produce the neceffary circulation. This happens principally in the Ipring and autumn; at which feafons it is neceffary to light fires in the fhalts, which are always efficacious for the purpofe defired.

Among the other ufes to which dephlogitticated air might be applied, Mr Cavallo reckons that of fecuring people from the dangerous effects of damps in mines, and other fubterraneons places. "If a large bladder," fays lie, " into which a folution of lime in water is introduced, be filled with dephlogifticated air, and a fmall wooden or glafs pipe be adapted to its neck, a man may hold that pipe in his mouth, and may breathe the dephlogifticated air; and thus equipped he may enter into thefe fubterranean places, amidtt the various claftic fluils contained in then, A large bladder of dephlogiticated air will ferve for above a quarter of an hour, which is a length of time fufficient for various purpofes; befides, if longer time is required to be fpent in thefe places, a perfon may have two or more bladders of dephloginicated air along with him, and may fhift as foon as the air of one is contaminated. Without the neceffity of any more complicated apparatus, the bladders full of dephlogiflicated air may be kept fopped by putting corks into the glafs or wooden pipes that are tied to their necks. This air might allo be ufed for diving-bells."

DAMSEL, from the French damoifel or damoifana, an appellation anciently given to all young people of tither fex, that were of noble or genteel extraction, as the fons and daughters of princes, knights, and barons: thus we read of Damfel Pepin, Damfel Louis le Gros, Damfel Richard prince of Wales.

From the fons of kings this appellation firit paffed to thofe of great lords and barons, and at length to thofe of gentlemen who were not yet knights.

At prefent danfel is applied to all maids or girls not yet married, provided they be not of the vulgar.

DAN, or Jor-DAN, which laf literally denotes "t the river Dan;" fo named from the people where it has its fousee, which is a lake called $P$ Piabla, from its round figure, to the north of its apparent rifing from the nountain Panium or Pancum, as was difeovered ing Plilip, Tcirarch of Trachonites; for on throwing light budies into the Phiala, he found them to emerge again at Paneum (Jofephus). From Paneum it rons in a direct counfe to a lake called Somachonites; as arar as Which it is called Fordan the Lefs; and thence to the lake Genefareth, or of Tiberias, where it comes increafed by the lake Samachouitis and its Springs, and is called the Greater Tordan; continuing its direct courfe foutliwards, till it falls into the Afphalites.

Dan (anc. geog.), a town to the welt of the fource of the Jordan; formerly called Lais (Jofhua, Judgres, Jufephus). This was the north, as Beertheba was the fouth, boundary of the Ifraelites; as appears from the common expreffion in Scripture, from Dan to Beer/bebu. At Dan Jeroboam erteted one of the golden calves (1 Kings xii.).
$D_{A N}$, , thic tribe, extended itfelf weftward of Judah, and was terminated by Azotus and Dora on the Mediterrancal (Jofephus).
DANAE, in antiquity, a coin fomewhat more than an obolus, ufid to be put into the mouths of the dead, to pay their paflage over the river Acheron.

Danse,

# D A N 

Danar, in fabulous hiflory, was the daughter of Acrifusking of Argos, by Eur fice. She was confined in a brazen tower by her father, who had been told by an oracle that his daughter's fon would put him to death. Lis endeavours to prevent Danae from becoming a mother proved fruitcefs; and Jnpiter, who was enamourcd of her, introduced himfelf to her bed by changing liumSelf into a golden fhower. From his cmbraces Danae had a fon, with whon the was expofed on the fea by her father. The wind drove the burk which carried her to the coats of the ifland of Seriphus; where the was faved by fonse fithormen, and carried to Polydectes king of the place, whofe brother, called Digys, educated the child called Poilons, and tenderly treated the mother. Polydectes fell in lowe with her ; but as he was afraid of her fon, he fent him to conquer the Gorgons, pretending that he wifhed Medufa's head to adorn the muptiuls which he was going to celebrate with Hippodamia the daughter of (Enomaus. When Perteus had victorioully finimed his expedition, he retined to Argus with Danae to the houfe of Acrifius, whom he inadvertently killed. Sonse fuppofe that it was Preetus the brother of Acrifius who introduced himfelf to Danac in the brazen tower; and inftead of a golden thower, it was maintained that the keepers of Danae were bribed by the gold of her feducer. Virgil mentions that Danae came to Italy with fome fugitives of Argos, and that fle founded a city called Ardica.

DANALDES (fab. hift.), the fifty daughters of $\mathrm{Da}_{2}-$ naus king of Argos. When their uncle Egyptus came from Egypt with his fifty fons, they were promifed in marriage to their coutias; and before the celebration of their nuptials, Danaus, who had been informed by an oracle that he was to be killed by the hands of one of his fons-in-law, made his daughters folemoly promife that they would deftroy their hubands. They were provided with daggers by their father; and all except Hypermneftra tained their hands with the blood of their coufins the firft night of their nuptials; and as a pledge of their obedience to their father's injunctions, they prefented him each with the head of the murdered fons of Kgyptus. Hypermneftra was fummoned to appear before her father, and aufwer for her difobedience in fuffering her hubband Lyneeus to efcape; but the unanimous voice of the people declared her innocent, and fhe dedicated a temple to the goddefs of Perfuafion. The fifters were purified of this murder by Mercury and Minerva by order of Jupiter ; but according to the more received opinion, they were condemned to fevere punihment in hell, and were compelled to fill with water a veffel full of holes, fo that the water ran out as foon as poured into it; and therefore their labour was infinite, and their punifliment eternal. The heads of the fons of Egyptus were buried at Argos; but their bodies were left at Lerna, where the murder had been committed.

DANAUS (fab.hill.), a fon of Behus and Anchinoe, who after his father death reigned conjointly with his brother Ægyptus on the throne of Egypt. Some time after, a difference arofe between the brothers, and D anaus fet fail with his fifty daughters in queft of a fettlement. He vifited Rhodes, where he confecrated a Atue to Minerva, and arrived fafe on the coaft of Pe ioponefus, where he was hofpitably received by Gela.
nor king of Argos. Gelanor had lately afeended the thronc, and the firk years of his reign were marked with diffeufions with his tubjects. Danats took advantage of Gelanor's unpopuliurity, and obliged him to leave tle crown. In Gelanor, the race of the Inchide was extinguifhed, and the Belides began to reign at Argos in Dallans. Some authors fay, that Gelanor voiuntarily refigned the crown to Danaus, on account of the wrath of Neptune, who had dried up all the waters of Argolus, to punith the impiety of Inachus. The fuccefs of Danaus invited the fifty fons of 庣gyptus to embark for Grece. They were kindly received by their uncle; who, either apprehenfiee of their number, or terrified by an oracle which threatened his min by one of his fons-in-law, caufed his daughters, to whom they were promifed in marriage, to murder them the lirlt night of their nuptials. Hisorders were executed. Hypermneftra alone fared the life of Lynceus: (See Danaides). Danaus at firt perfecuted Lynccus with unremitted fury; but he was afterwards reconciled to hin, and he acknowledged him for his fon-in-taw and fucceflor after a reign of 50 years. He began his reign about 2586 years before the Chritian cra; and after death he was honoured with a fplendid monument in the town of Argoz, which Aill exitted in the age of Paufanias. According to Efchylus, Danaus left Egypt, not to be prefent at the marriage of his daughters with the fons of his brother, a conneetion which he decmed matawful and impious.

DANCE, or Dancing, as at prefent practifed, may be defincd, "an agreeable motion of the body, adjulted by art to the meafures or tune of inftruments, or of the voice."-But, according to what fome reckon more agreeable to the true genius of the art, dancing is "the art of expreffing the fentiments of the mind, or the paffions, by meafured fleps or bounds that are made in cadence by regulated motions of the body, and by graceful gettures; all performed to the found of inufical inftruments or of the voice."

There is no account of the origin of the practice of dancing among mankind. It is found to exitt among all nations whatever, even the mont rude and barbarous; and, indeed, however much the affiltance of art may be neceflary to make any one perfect in the practice, the foundation mult certainly lie in the mechanifm of the human body itfelf.

The connection that there is between certain foundz and thofe motions of the human body calied dancing, hath feldom or never been inquired into by plilofophers, though it is certainly a very curious fpeculation. The power of certain founds not only over the human fpecies, but even over the inanimate creation, is indeed very furprifing. It is well known, that the moit folid walls, nay the ground itfelf, will be found to thake at fome particular notes in mufic. 'This Atrongly indicates the prefence of fome univerfally diffufed and exceedingly elaftic fluid, which is thrown into vibrations by the concuffions of the atmofphere upon it, produced by the motion of the founding body.-If thefe concuffions are fo ftrong as to make the large quantity of elaflic fluid vibrate that is difperfed through a ftone wall or a confiderable portion of earth, it is no wonder they fhould have the fame effect upon that invifible and exceedingly fubtile matter that pervades and feems to refide in our nerves.

Some there are that have their nerees confructed in fuch a manner, that they camot be affeeted by the founds which affect others, and fome fcarce with any, while others have fuch an irritability of the nerves in this cale, that they cannot, without the greatelt difieality, fit or fland Atill when they hoar a favourite pisce of inutic played.

It is conjectured by very ersinent philofophers, that all the fenfations and paffious to which we are fubject do immediately depend upon the viluations excited in the nervons fluid above mentionerl. Hence, mufical founds bave the greatef power over thofe people who are of a delieate ienible frame, and who have frong palions. If it be true, therefore, that every paffion in the human nature inmediately depends upon a certain affection of the nervous fyltem, or a certain motion or vibation in the nervous faid, we thall immediately fee the origin of the diferent dances among different nations. One kind of vibration, for inflance, raifes the paffions of anger, pride, \&c. which are indifpenfably neceffary in warlike pations. The founds, for fuch there are, capable of esciting a fimilar vibration, would naturally conftitute the martiel mufic among fach nations, and dances conformable to it would be inltituted. This appears to be the cafe particularly among barbarous nations, as we fhall prefently have occafion to remark. Other vibrations of the nervous fluid produce the palfions of joy, love, \&c.; and founds rapable of exciting thefe particular vibrations will immediately be formed into mufic for dances of another kind.

As barbarous people are obferved to have the flronget paffions, fo they are alfo obferved to be the moft tafily affequd by founds, and the moft addicted to dan. cing. Sounds to us the mof difagreable, the drumming with ficks upon an empty cafk, or the noife made by blowing into reeds incapable of yielding one mufical note tuierable to us, is agrecable mufic to them. Much more are they affected by the found of inftruments which have any thing agreeable in them. Mr Gallini informs us, that "The fpirit of dancing prevails almof beyond imagination among both men and women in moft parts of Africa. It is even more than inflinct, it is a rage, in fome countries of that part of the globe. - Upon the gold coalt efpecially, the iwhabitants are fo paffionately fond of it, that in the midft of their bardeft labour, if they hear a perfon fing, or any mufical infrument played, they cannot refrain from dancing. - There are even well attefted ftories of fome negroes finging themfelves at the feet of an European playing on a fiddle, intreating him to defift, unlefs he had a uind to tire them to death; it being impelfible for them to ceafe dancing while he continued playing." -The famc thing is found to take place in America, though, as the inhabitants of that continent are found to be of a more fierce and barbarous nature than the African nations, their dances are ftill more uncouth and barbarous than thofe of the negroes. "In Mexico, fays Gallin!, they have alio their dances and mufic, but in the mult uncouth and barbareus Byle. For their fymphony they have wooden drums, fomething in form of a kettle-drum, with a kind of pipe or fla gellet, made of a hollow cane or reed, but very grating to an European ear. It is obierved they lore every shing that makes a noife, how difarereable foever the
found is. They will alio hum over fomething like a tune when they dance 30 or 40 in a circle, Mretching out their hands, and laying them on each others ihoul. ders. They tamp and junus, and ofe the molt autic gettures for feveral homs, till they are heartily weary. And une or two of the company fometimes itce vait of the ring to make foore for the rett, by thowing feats of activity, throwing their lanecs up into the air, catching them again, benling brekwards, and foringing forwards with great agility."

The ori gin of dancing among the Greeks was mult certainly the fane as among all other nations; but as they proceeded a certain length in civilization, their dances were of confequetwe nore regular and agreeable than thofe of the nore baridarous nations. They reduced dancing into a kind of regular fyttem; and had dances proper for exciting, by means of the fympathy above mentipned, any paffion whatever in the minds of the beholders. In this way they are faid to have proceeded very great lengths, to us abfolutely incredible. At Athens, it is faid, that the dance of the Eumenides or Furies on the theatre had fo expreffive a character as to ftrike the fupectators with irreffitible terrer: men grown old in the profeflion of arms trembled; the multitude ran out ; wumen with child milicarred; people imagined they faw in earnelt thofe terrible det. ties commilfioned with the vengeance of heaven to purfue and punifh crimes upon earth.

The Greeks had martial dances, which they reckoned to be very ufeful for keeping up the warlike fipirit of their youch ; but the Romans, though equally warlike with the Greeks, never had any thing of the kind.This probabiy may be owing to the want of that romann tic turn for which the Greeks were formarkable. The Romans had no heroes among them, fuch as Hercules, Achilles, or Ajas ; nor does the whole Roman hittory furvifh an example of a general that made war after the manner of Alexander the Great. Though their foldicrs were as valiant as eves the Greeks could pretend to be, the object with them was the honour of the republic, and not their own perfonal praife. Hence there was lefs fury, and much more cool deliberate valour, exercifed by the Romans, than any other mation whatever. The paffions of pride, refenticent, obftinacy, \&c. were excited in them, not by the mechanical means of mulic and dancing, but by being taught that it was their chief honour to fight for the republic.--It does not however appear, that the Romans were at all lefs capable of being affected in this mechanical manner than the Greeks. When dancing was once introduced, it had the very fame effects at Rome as at Athens.

Among the Jews, dancing feems to have made a part of the religious woribip on fome occations, as we learn from fone paffages in the Pfalms, though we do not find either that or finging poitively enjoined as a divine precept.-In the Chriftian churches mentioned in the New Tefament, there is no account of dancing being introduced as an ack of worfhip, though it is certain that it was ufed as fuck in after ages. Mr Gallini tells as, that " at Linoges, not long ago, the people ufed to dance the round in the choir of the church which is under the invocation of their patron faint; and at the end of each pfalm, inflead of the Gloria Patri, they fung as follows: S: Marcel, pray for is, and see will dinus in benour of yous."-'Though
dan-

Dance. dancing would now be looked upon as ti.e highert degrec of profanation in a religivas aftembly, yet it is certain, that dancing, confictered as an exprefiton of joy, is no more a motamation than finging, or than frople fpeaking: nor can it be thenght in the lealt mere abfurd, that a Chrittion thould danere for joy that Jetus Chrift is rifen from the deat, than that bavid dancod before the ark when it was sturned to him aftera long abfence.

Ihato reduces the dances of the ancients to three clafies. I. The military dances, whicle tended to make the body robult, active, and well-difpoled for all the exerciles of war. 2. The domettic danaes, which hatd for their object an agreeable and inmoent velaxation and amulement. 3. The mediatorial darics, which were in we in expliations and facrifices-Of military dances there were two lorts: the gymogetigte dance, or the dance of chitdren; and the enoptonn, or armed dance. 'The Spartano had invented the firt for an Panly excitation of the courage of their children, and to lead them on infenfibly to the esemeile of the armed ditute. 'This chidrens dance ufed to be executed in the public place. It was compored of two choirs; the one of grown men, the other of children; whence, being chiefly defigned for the latter, it touk its name. They were both of them in a thate of nudity. The choir of the children regulated their motions by thofe of the men, and atl danced at the fame time, finging the poems of 'Thiles, Alcinan, and Dionyfodotus.The moplicn or fyrrbic was danced by young men arined cap-a-pee, who executed, to the found of the fiute, all the proper movernents either for attack or for defence. It was compored of four parts. - The firt, the podifin or footing; which confited in a quick flifting motion of the feet, luch as was neceffary for overtaking a llying cnemy, or for getting away from him when an irsermatch.- The fecond part was the siphifm; this was a kind of mock-fight, in which the dancers imitated all the motions of combatants; aimings a froike, darting a javeliz, or dexteroufly dodging, parrying, or avoiding a blow or thruft. The third part, called the komos, confifted in very high leaps or vankinge, which the dancers frequently repeated, for the beiter ufiteg themfelves occationally to leap over a ditch, or fpring over a wall. The etracomos was the fourth and laft pant: this was a fquarc figure, execured by How and majeftic movements; but it is uncertain whether this was every where executed in the fame manner.

Of all the Greeks, the Spartans werc thofe who mont cultivated the Pyrrhic dance. Athenxus relates, that they had a law by which they were ohliged to excreife their children at it from the age of five years. This warlike people contantly retained the cuftem of accompanying their dances with ligmons and fongs. The following was fung for the dance called trichoria, faid to be infituted by L.ycurgus, and which had its name from its bcing conpofed of three choirs, one of children, another of young men, and the third of old. The eld men opened the dance, faying, " In time palt we were valiant." "The goung mon anfwered, "TVe are fo at prefent." "Wc thall be till more fo when rur time conies," replied the chons of children. The spartans never danced but with real ams. In procefs of ime, lwowever, other nations cance to wif only weat
pons of wood on fuch occaflons. Nay, it was oniy fo manec. late at the days of Atheneus, who lived in the fecond century, that the dancers of the Pyrrnic, infteal of arms, caried only Halks, iny-boumd wands (thyrfus) or recds. But, even in Arillote's days, they had begrun to ufe thyrfufes inftead of pikea, and lighted torches in lieu of javelins and fwords. Withthefe torches they exceuted a dance called the conflagration of the atorh.

Of the dance; for amufement and recreation, fome were but fimply ganlols, or fportive exercifes, which had no charactcr of inntation, and of whech the greater part cxill to this day. The others were more complex, more agrecable, figured, and were always accompanied with linging. Among the firft or fimple ones was the afoliugmas; which contifted in jumping, with one foot only, on bladders filled with air or with wine, and rubbed on the outide with oil. The dypodfum was jumped with buth feet clofe. The kighellefis was what is called in this country the jomerfet.-Of the fecond kind was that called the reine-frefs, of which there is a defuription in Longinus, and the Lomin dances: thefe latt, in the original of their inftitution, had nothing but whas was decent and modeft; but, in time, their movemente came to be fo depraved, as to be employed in expreffing uuthing but voluptuoufnets, and even the grodfelt oblicrnity.

Anong the ancients there were no feftivals nor religious aftemblies but what were accompanied with fong ${ }^{3}$ and dances. It was not held pollible to celebrate any myttery, or to be initiated, without the intervention of thefe two arts. In hart, they were looked upon to be fo effential in thefe kinds of ceremonies, that to exprefs the crime of fuch as were guilty of revealing the faceed mylteries, they employed the word kbeifax, "to be out of the dance." The molt ancient of thefe religious dances is the Bacchic; which was not only confecrated to Bacchus, but to all the deities whofe fellival was celebrated with a kind of enthutiafin. The molt grave and majeltic was the byporchematic: it was executed to. the lyre, and accompanied with the voice.-At his return from Crete, Thefeus inflituted a dance at which he himfelf affilted at the head of a numerous and fiplendid band of youth round the altan of Apollo. The dance was compofed of three parts; the flrophe, the ontillrophe, and the futionary. In the ftrophe, the movements were from the right to the left; in the antiltro. phe, from the left to the right. In the itationary, they danced before the athar; fo that the Itationary did not mean an abfolute paufe or relt, but onily a more how or grave movernent. Plutarch is perfuaded, that in this dance there is a profound myftery. He thinks, that by the Arophe is indicated the mution of the world from ealt to welt; by the antitrophe, the motion of the planets from the weft. to the eatk; and by the ltationary, the llability of the earth. 'To this dance Thefeus gave the name of geranos, or " the crane ;" becaufe the digures which characterifed it bure a refemblance (1) thufe: deferibed by cranes in their flight.

With regard to the modera praxiec of dancing as an art, there are few directions that can be of much ferviece. The following is extracted from Mr Gallini's defcrip. tion of the feveral theps or movements.
"The dascing (lays he) is generally on a theatse, or in a falvon or room. At the theatec there are four farte so te confidered. 1. The neaiett frone to the

Dance. fpectators. 2. and 3. The two fides or wings. 4. The furtheit front from the fpectators.
"In a faloon or room, the place in which are the fpectators decides the appellation refpectively to them of right and left. The dancer thould place himfelf in as advantageous a point of view to them as poflible.
"In the dance itfelf, there are to be diftinguifhed, the attitude of the body, the figure, the politions, the bends, the rifings or leaps, the fteps, the cabriole, the fallings, the flides, the turns of the body, the cadences.
" The atitude of the body requires the prefenting one's felf in the moll graceful manner to the company.
" The figure is to follow the track preferibed to the Ateps in the dance.
"T The porfition is that of the varied attitudes, which mult be at once ftriking and eafy, as alfo of the different excrions of the legs and feet in dancing.
"The lends are inflexions of the knees, of the body, of the head, or the arms.
" The rifings are the contraft to the bends, the extenfion of the knee. One of thefe two motions nect farily precedes the other.
" The $f_{c} p$ is the motion by the foot or feet from one place to another.
"The leap is executed by fpringing up into the air; it begins with a bend, and proceeds with a quick extenfion of the legs, fo that both feet quit the ground.
" The cabriole is the croffing, or cutting of capers, during the leap, before the return of the feet tu the ground.
"The falling is the return of the feet to the ground, by the natural gravitation of the body.
"The fide is the action of moving the foot along the ground without quitting it.
"The turn is the motion of the body towards either fide, or quite round.
"The cadence is the knowledge of the different meafures, and of the times of novemeni the molt marked in the mufic.
" The track is the line marked by the dance: it may be either ftraight or curve, and is fufceptible of all the inflections correfpondent to the variuus defigns of the compofer.- There are the right, the diametral line, the eincular line, and the oblique line. The right line is that which goes lengthwife, reckoning from one end of the room towards the other. The diametral line is acrofs the room, from one fide to the other. The eircular line is waving, or undulatory, from one place to another. The oblique line proceeds obliquely from one quarter of the room towards another.- Each of thefe lines may directly or feparately form the dancer's track, diverffied with fteps and pofitions.
"The regular figure is when two or more dancers move in contrary direftions; that is to fay, that when one moves towards the right, the other moves to the left.-The irregular line is when the couples figuring together are both on the fame fide.
"Commonly the man gives the right hand to the lady in the beginning or ending of the dance, as we fee in the minuct, louvre, \&e.
"When a greater number of dancers figure together, they are to execute the figure agreeably to the compofition of the dance, with fpecial attention to keep an eye conftantly on the partner.-When, in any given dance, the dancers have danced for fome time in the
fame place, the track is only to be confidered as the conductor of the $\beta$ leps, but not of the figure; but when the dance continues, without being confined to the fame place, then the track muft be confidered as the conductor both of the fteps and of the figure.
" Now, to obferve the figure, the dancer muft have placed himfelf at the heginning of the tract upon which he is to dance, and comprehend the figure before he himfelf begins it. He is to remark and conceive whether the figure is right, diametral, circular, or oblique; if it is progreflive or retrogreflive, or towards the right or left. He flould have the air played or fung to him, to underfand the movement.-- Where the tracks crofs one another, the fleps of each of the couples muit leave a fufficient diflance between them not to confufe the ligure.
" There are commonly reckoned ten kinds of pofitions, which are divided into irue and falf, five each.There are three principal parts of the foot to be obferved; the toes, the hecl, and the ancle.
" The true politions are when the two feet are in a certain uniform regularity, the toes turned equally outwards. - The falfe are divided into regular and irregular. They differ from the true, in that the toes are cither both turned inwards; or if the toes of one foot are turned outwards, the others are turned inward.
"In the firt of the true pofitions, the heels of the two feet are clofe together, to that they touch; the tocs being turned out. In the fecond, the two feet are open in the fame line, fo that the diftance between the two heels is precifely the length of one foot. In the thind, the heel of one foot is brought to the ancle of the other, or feems to lock in with it. In the fourth, the two tect are the one before the other a foot's length diftance between the two heels, which are on the fame line. In the fifth, the two feet are aerofs, the one before the other ; fo that the heel of one foot is directly oppofite to the toes of the other.
"In the firft of the falfe pofitions, the toes of both fect are turned inwards, fo that they touch, the heels being open. The fecond is, when the feet are afunder at a foot's diffance between the toes of each, which are turned inward, the heels being on a line. The third is, when the toes of one foot are turned outwards, the other inwards, fo that the two feet form a parallel. The fourth is, when the toes of the two feet are turned inwards; but the toes of one foot are brought nearer the ancle of the other. The fifth is, when the toes of the two feet are turned inwards, but the heel of one foot is oppofite to the toes of the other.
"There are mixed pofitions, compofed of the true and falfe in combination; which admit of fuch an infinite variety, and are in their nature fo unfufceptible of defcription by words, that it is only the fight of the performance that can give any tolerable idea of then.
"Of the bends of the knee there are two kinds; the one fimple, the other forced. The fimple bend is an ingexion of the knees without moving the heel, and is executed with the foot flat to the ground. The forced bend is made on the toes with more force and lower.
"Much is to be obferved on the head of hepps. $^{\text {. Firft, }}$ not to make any movement before having put the body in an upright pofture, firm on the hauuches.
"Begin with the inflexion of the knee and thigh; advance one leg foremoft; with the whole foot on the

Dance. ground, laying the Itre!s of the body on the advaneed leg.
"There are fome who begin the ftep by the point of the toes; but that has an air of theatrical affectation. Nothing can be more noble than a graceful eafe and dignity of Atep. The quantity of ateps ufed in dancing are almoft innumerable ; they are neverthelefs reducible under five denomiations, which may ferve well enough to give a general idea of the different morements that may be made by the leg, viz. the direct itep, the open Atep, the circular Itep, the twitued ttep, and the cut flep.
"t The direg tlep is when the foot goes upon a right line, either forwards or backwards.

The open ftep is when the legs open. OE this ftep there are three kinds: one when they open outwards; another, when, deferibing a kind of circle, they form an in-knee'd figure; a third, when they open fideways; this is a fort of right llep, becaule the digure is in a right line.
" The round ttep, is when the foot, in its motion, makes a circular figure, either inwards or outwards.
"The twifled Itep, or pas tortille, is when the foot in its motion turns in and out. There are three kinds of this Itep; one forwards, another backwards, the third fidelong.
"The cut 1tep is when oneleg or foot comes to flike againft the other. There are alfo three forts of this fep; backwards, forwards, and fidelong.
"The fteps may be accompanied with bendings, rifings, leaps, cabrioles, fallings, flidings, the foot in the air, the tip-toe, the relt on the heel, quarter-t urns, half-turns, three-quarter turns, and whole-turns.
"There nay be practifed three kinds of bends, or finkings, in the 1teps; wiz. bending before the lep proceeds, in the act of Atepping, and at the lat of the itteps.
"The beginning or initial fink-pace is at the firlt fetting off, on advancing the leg.
" The bend in the act of depping continues the march or walk.
"The final fuk-pace clofes the march.
"The rifing is juit the reverfe of the bend, or finkpace, which fhall have preceded it.
"Some great mafters in the art of dancing, having obferved that mufic, which is infeparable from it, was capable of being preferved and conveyed by the mulical characters, imagined by analogy, that the like advantage could be procured to the compofition of dances. Upon this plan they attempted what is called the chorography, an art which they fuppofe was cither utterly unknown to the ancients, or not tranfmitted to us from them.
" It may indeed be eafily allowed, that the track or figure of a dance may be determined by writton or engraved lines; but thofe lines will neceffarily appear fo perplexing, fo intricate, fo difficult, if not impoffible to feize, in their various relations, that they are only fit to difguft and difcourage, without the polfibility of their conveying a \{atisfactory or retainable inftruction. -Thence it is, that the article of Chorography in the French Encyclopédie is univerfally exploded as unintelligible and ufelefe: though nothing more than an ele.
mentary indication of the art ; and anexplanation, fuch as it is, of fome of the technical terms of it."

Stage-D.ances. 'The Circeks were the firt who united the dance to their tragedics and comedies; not indeed as making part of thofe fpectacles, but increly as an acceffary.

The Romans, as ufual, copied after the Graks; but in the reign of Augudus they left their indenctors far behind them. Two very extraordinaty men made their appearance at that time: they invented a nes fpecies of entertainment, and carried it to an afouithing desree of perfuction. Nothing was then talked of but the wondertul talents and amaziag performance, of Pylades and Bathylus, who were the fillt to introduce among the Romans what the French call the bulk: "d'sition, wherein the performer is both actor and dancer.

Yylades undertook the bard takk of reprefenting, with the affiltance of the dance alone, Atrong and pathetic fituations. He fucceeded perhaps beyond his own expectation, and may be called the father of that Ityle of dancing which is known to us by the name of grave ar ferious pantomime.

Bathylus an Alexandrian, and a freedman of Mc. conas, took upon himfelf to reprefent fuch fubjects as required a certain livelinefs and agility. He was handfome in his perfon; and the two great feourges of Roman follies, Perlins and efpecially Juvenal, fpeak of him as the gallant of every woman in Rome. The latter, in his eynic ityle, even gues $f_{0}$ far as to fay, that when Bathylus performed the dance ealled, alter the uane of a cclebrated female dareer, Cbiromeros-Leda, the graveit matron was turned off her guard, and the young virgin longed for the dancer's addrefles.

Nature had been exceflively partial to thofe two men. They were endowed with genius, and all the exterior charms that could captivate the cye. By their Itudy, application, and a dctire to eftabliih a lafting reputation, they difplayed to the greatelt advantage all the refources which the art of dancing could fupply. 'Ihefe, like two phenomena, difappeared, and never did the world fee "their like again." Government withdrew its protection, the art gradually fonk into obleurity, and became even entirely forgutten on the acceltion of Trajanus to the empire.

Thus buied with the other arts in entire oblivion, dancing remained uncultivated till about the 15 th century, when ballets were revived in Italy at a magnificent entertainment given by a nobleman of Lombardy at Tortona on account of the marriage between Galeas Duke of Milan and Llabella of Arragon. Esery refource that poetry, mulic, dancing, and machinery could fupply, was employed and exhaulted on the occalion. The defcription given of fo fuperb an entertainment excited the admiration of all Europe, and excited the emulation of feveral men of genius, who improved the hint to introduce among their countrymea a kind of Cpectacke equally pleafing and novel.

It would feem, however, that at firlt the women had no thare in the public or theatrical dance; at lealt we do not fee them mentioned in the various entertainments given at the opera in Paris till the 21 It of January 1681, when the then Dauphinefs, the Princefs of Conti, and fome other ladies of the firft diftinction in the court of Louis XIV. performed a ballet with the

## D A N

Tasee. the two fexes ferved to enliven and render the fpectacle nore pleafing and far more brilliant than it ever was at any other perioch. It was received with fo much ap. plaufe, that on the 16th of May following, when the fane opera was acted in Paris at the theatre of the Pa. luis Royal, it was theaght indifpenfable for the flecce!s of that kind of entertamment to introduce fernale dano sers. They have continued eqer face to be the principal fupport of the opera.

The dance is now in fuch commendation, that, particularly in France, the opera-houfe feems rather an academy for dancing than calculated fer the reprefentation of lyrie poers. The difgulting and immoderate lungth of their recitatives is une of the chief caufes of that general tafte for dancing which prevails amongt them. A wit being afsed one day what could be done to kecp up an opera thireatened with a molt complete damation? "Do! (fays lte); why, lengthen the dances and horten the petticoats." So evident it is, that fanging, though apparently the chicf purpole of an opera, is by no ineans the moff pleafing pant of the entertainanent for the fectators.

Thus, what was at firlt introduced as a mere acecfEary to the mulcal performanio, became in procefs of time its only fuppont ; and this circumptance exsited the emulation of feveral eminent ballet-maters. The art, however, of eompofing thofe grand dances, which are nuw fo much adnired, was for many years in a fate of iufancy, till Monficur Novette ftept forth and gave it that degree of perfection which it feems imponfible to exceed. This celebrated ballet-matter and performer, in a work lately publified, has with great elegance and ingenuity delineated the rature, objects, and powers of daneirg, enumerated the proper reguifites to give it efiect, and thown how much it may be eanobled by an acquaintance with the kindred arts.

Ballets, he oblerves, have hitherto been the faint Netch only of what they may be one day. An art entirely fubfervient, as this is, to tafte and genius, may receive daily variation and improvements. Hittory, painting, mythology, poctry, all join to raife it foom that oblcurity in which it lies buried; and it is truly furpriling, that compofers have bitherto difauined fo many valuable tefources.

According to our author, the reafon why this ant has remaincd fólong in its infancy, is becaufe its effcets bave been reftrained to the tranfitory ones of fre-works caleulated only to pleafe the eye; and it wever was fuppofed to have powers fufficient to ipeak to the heart: whereas it may vie, he fays, with the bet dramatic pieces, prove equally interelting, and captisate the fpectator by the charms of the nout complete illufion.

If ballets, therefore, faya he, " are for the moft part uninterefting and uniformly dall; if they fail in the charakecitic expreflon which conflututes their eflence, the defect does nut origieate from the art itfdf, but thould be afcribed to the artitts. Are then the latter to be told, that daneing is an imitative art? I am indeed inclined to think that they know it not, fince we daily fee the generality of compofers facriace the beauties of the dance, and give up the graceful nativelé of fentiment, to become the fervile copients of a cermin number of figures, known ard backneyed for $\mathrm{N}^{\circ} 97$.
above a century; fo that the ballets of Fhacton, of of any ancient opera, revived by a modern compofer, would jruve fo very fimilar to former ones, that one would think they bave undergone no alterations, and are the fame in every ftep.
"Ballut-mafers ihould confult the productions of the mut eminent painters. This would bring then nearer to nature, and induce them to avoid, as often as porfible, that fymmetry of figures, which, by repeating the objest, prefent two different pietures on ene and the fane canvas.
"Thofe fymmetrical figures from right to left, ace cording to iny judfomeat, are fupportable only in the entrées, whicb are not meast to exprefs any thing in particular, but are only calculated to afford fome relicf to the principal dancers. They may be introduced in a general dance at the conclufion of an entertainuent, they nay alfo be admitted in the pas of four, fix, at. though in my opinion it be ridiculuns even in this cafe to prefer the difplay of bodily flrength and agility to expretion and fentiment. But fuch figures ronit give way to nature in what we term bullets dactich. An initance, though perhaps not very forcible, may ferve to elucidate and fupport my argunent.
"it the fudden and unexpected appearance of fome young fauns, a troop of nymphs take themfelves to flight with equal affright and precipitation, The former are in purfuit of the latter with that eagernefs which the very hope of pleafure can in. fpire. Now they fop to obferve what imprefion they have made on the nymphs; thefe at the fame time, and for a fimilar reafon, check their earcer: with fear they forvey their purfurers, endeavour to guefs at their intentions, and provide for a retreat to fome \{pot, where they may relt fecure from the dangers that threaten then. Both troops now join, the nymphe refit, defend themfelves, and at lats etect theis efaape with no lefs efwiftnefs than dexterity.
"This I call a bufy active fene in which the dance, as it wete, hould Speak with energy. Hete turied and fymmetrical figures cannot be introduced without a manifett vilation of the truth, without deftroying the rules of probability, and without weakening the action and leffening its effect. -This feene fhould be confpicuous; for its beautiful diforder, and the art of the compofer, mutt bere be the handnaaid of nature.
"A ballet-mater, devoid of tafte and difcerament ${ }_{\text {s }}$ will make of this a mechanical piece of daneing, and thus deprive it of the effect it was calculated to produce for want of entering into the fpirit of it. Elis nymphs and fauns will be arranged upon a puallel hise, he will place the former in attitudes aukwardly uniform, and infill on the latter holding up their arms to an even allitule; rather than deviate from the beaten path, and the antique rules of opera danciner, he will cautiouny avoid to have, on the right and lfft , his nyruphs placed in unequal numbers, but will reduce a feenc of action, which ought to be fupported with fpirit, to an exerelfe equally affected and uninteret. ing.
" Perhaps fome ill-difpofed critics, fo far itrangers to the art as not to judge of it from its various effects, will maintain, that the above fcene fhonld prefent ouly twa diferent cbjects, the one pourtrayed ia the loves

Dance. fick fauns, the other expreffed by the afright of the nymphs. But how many flades may ferve to embetliih thore pistures? how varicd may be the flrokes of the pencil? how oppolite the lights? and what a number of tints ought to he employed in order to draw from this twofold fituation a multiplicity of images, ead more lively and fyirited than the other?
"As all men thare the fatne pafions, and thefe differ in proportion to their fenfations and feelings, they may therefore be worked upon more or lefs poweriul. ly in proportion as they manifett themfelves outwardly with more or lefs force and impetuofity. This principle once acknowledred, and nature indeed infinces it daily, it would certainly he more to the purpofe to diverlify the attitudes and vary the expreffion; for then the pantomime action of each perfonage would be divelled of a difgulting uniformity. The eruth of imitation and the ikill of the painter would compicuouly appar in giving a different afpect to the features, fome of them expreflive of a kind of ferocity, others betraying lefs eagernefs, thefe calling a more tender look; and to the reft, the languifhing air of coluptuoufinefs. The thetch of this birit pieture naturally ladds to the compolition of the fecond: bere fone nymphs appear divided between far and defire; there fome others exprefs by the contrat of their attitudes the varions emotions of their foul. Some are more foornful than their companions, whilt others betray a curionity equal to their fears. This enfernble gives life to the wholc picture, and is the more plesling that it is perfectly confifent with nature. From this expoetion, you whll not hefitate to ayrce with me, that fymmetry, the offspring of art itfelf, hould never frid plice in the ballets d'action.
" I flall beg leave to encquire of all thefe who reafon from habitual prejudice, whether they will look for their favourite fymmetry in a herd of fleep flying from the wolf, or amongtt wretched peafants leaving their huts and fields, in order to flelter themfelves from the fury of a party of enemies? By no meas. But the art lies in concealing art itfelf; ony aim is by no means to introduce diforter and confufion; on the contrary, I will have regulasity even in irregularity. What $\tilde{I}$ molk infift upon is, the introm ducing of well concerted groups, lituations forcibly expreffed, but never beyond uature, and above all, a certain eafe in the compolition, which betrays not the laburur of the compofer. As for the figures, they are Jikely to pleafe only in proportion as they quickly fucceed each other, and are devifed with equal tate and elegance."

A bulbet perfect in all its parts, our author proceeds to oblerve, is a pieture, drann from life, of the manners, dreftes, ceremonies, and cultoms of all mations. It mult therefore be a complete pastomime, and through the cyes Speak, as it were, to the very foul of the fpectator. If it wants cesprefion, if it be deficient in point of fitation and feemery, it detgenerates intor a fpectacle equally flat and monotone.

According to Plutarch, a ballet is, if the exprefion may be alluwel, a mate converfation, or a fpeaking and animated picture, whofe language confifs of motions, fyures, the geftures. - Thefe figures, fays our author, are unlimited in their number, becaufe there we a thoufand things that the ballet may exprefs.

Vol. V. Part 11 ,

Phrynicus, one of the ohdell tragedy writes, fabp, flat dave. he could find in oun batlet as many tigues as the fea berm, rolls waves in a ligh vinter tide.

A well compoled ballet, therefore, may do without the affilance of words: M. Nowrre even rematlss, that thele only fave to weaken the attion, and partly deftioy itseffects. He has no opirion of a pantomiune which, in order to be undertnod, man burrow the hap of a verbal explanation. "A ny ballet whatever (fayabe), deflitute of intriguc, aetion, and interent, difplayints nothing more than the mechanical beantics of the ant, and, thongh decorated with a pormpous title, is mintel. ligible throughout, is not unlike thufe portraits and pictures to which the painters of old finoferibed the names of the perfonages and action they meant to reprefent: becaufe they ware imperfeet in point of imitation, the fituarions weakly expreffet, the outimes in correct, and the colours unfermly.
6. When dancers thall feel, and, Proteus like, transform themfelves into various fhapes to exprels to the life the contlict of pafions; when their featutes, their very look 3 , thall fpeak their inward feeling; ; when, cxtending their arms beyond the natrow circle preferibed by the rigid sules of pedantry, and with equal grace and judginent giving them a fuller fcope, they thall by propet tituations defcribe the gradual and fuccemive progrefs of the paffons; when, in fine, they call good fenfe and genius to the affifance of their art; then they may expect to diltinguifh themfolves: explanatory fpeeches will become ufekfs; a mute but powaful eloguence will be fubftituted to much better cfice: each motion will be a fentence; every attitule will poustray a lituation; each gellure convey a thought, and each ergance a new fentiment: every part will pieafe, becaufe the whole will be a true and faithful imitation of nature."

A ballet, in whateves ftyle it may be, thonk, ace cording :o A ifitotle, be compoted, as well as pociry, of two different parts, which he calls parts of quality and palts of quautity. Nothing exitts in nature with. out matter, form, and figure : the ballet therefore be comes a mere nonentity, if it be deficient in any of thore eflential parts, which mark and condlitute the being of any one thing animate or inaninate. 'The matter here is the fubject intended for reprefentation; it; form confif- in the ingenious dill :ibution of the plan; and the various compsunding parts conititute its figure. Form therefore contains the parto of quality, and the extent the parts of quantity.

Thas it appears, that ballets are in fome degree fubject to the rules of poetical compolition. 'I'hey", severthelefs, difis from tragedies and comecties, in rhat the former are not fubject on the these unicies of time, place, and astion: fitt they require an whity of plot, in order that the varions fectes mey meet and tad on the fame point.- The ballet, therefore, may bu termed the brother of the drama; though not reftrained to its !nicter mules: which only ferve to cramp the imagination, check ita 日lisht, and confine genius ; and if a chered to, mull fet afide all thought of competition of bullets, by depriving them of their chief omament, pleahng variety.
M. Noverre confiders tragedy as tl.e fubjue mon fuitable for the art of dancing. The former abouncs in nuble incidents, fituations, sec and ible produce 4 P

# D A N 

 forcibly expreffed by great characters than by common men : the imitation is of courfe lels dificult, the action in the pantomine more fignificant, matural, and intelligible." 'lhe bufinefs of a dillful mafter (he obferves), is to forefee, as it werc, at one glance, the general effect that may refult from the enfenble, and never give the preference to one fingle part over the whole. The only way for hin to beftow lis thughts on the greateft number, is to forget for a while the principal characters of the drama: if his whole attention fhuld entirely be taken up with the parto of his firft dancers of both fexes, the action is fulpendad, the feenes are flow in their progrefs, and the whule performance math fall fhort of i:s difivel effect.

In the tragedy ot Merope by Voltaire, the principal chactiers are, Micrope, Pulifonte, E.file, and Narbas: Lut ahllyugh the parts of the inferior actors are not of equal importance, yet they all concur to the general action, and to the progreflion of the drama, which would appear deficient in fome pants, thould either of thofe charaEter, be uanting in the reprefatation. Ne ufelefs perfonace hould be obtruded on the fage. Every thins the refore that may tend to we:ken the effect of the drama ought to be catefully avaid. ed, and only that number of ators introduced which is barely requifite for the execution of the performance.
"A ballet is a production of the lame kind. It mull be divided into acts and feencs, each of which, as well as the aft itfelf, mut have its beginning, its middle, and its end ; that is, in other words, expofition, plot, and denouement.
"I have obfered above, that the principal performers in a ballet thould te forg:tten fur a whik: My reafon is, that, in my opinion, it is eatier to give AtiLing patts to Hercules and Omphale, Aviadne and Bacchus, Ajax and Ulyfes, \&ec. than to 24 pufons in their retinue: If thefe have nothing to fay, they are fuperfuous, and of courfe oughi to be rejeet. ed; but, if they are to fpeak, hit their converfation be confonant with that of the principal characters.
"The dificulty, therefore, does not lie in amigning a primary and diftinctive part to Ajox or Ulyfits; bance it 'Springs naturally from the i: partance of their lituation in the play: but in introducing the fourers in a becoming ityle, giving them parts of more or lefs importance, cunnected with the astion of the two heroes; in introducing women, fome of whom will appear concerned for Pjax, ard the greater number forwing their paitiality for thyffs. The trinmph of the latter, the former's death, prefent to the man of genius a feries of images that vie with each other in puint of incerelting and pittorelque fituations. Thefe, by means of a culuring lkiliully contralted, caunot hut produce the mot lively fenfations. In fine, a ballet pantominae Chould be damatic in all its parts; and the figure-daicers, who foccetd to the prinipal pe:formes, ought to continue the fease, nut by a number of fymmetrical figures and ourdied feps, but by that kind of animated expering which keeps up the attention of the Ipcetators th the main fubject tor which the preceding ators have puepared the aucience.

## D A N

" Yet, either through ignorance or in confequence of a vitiated labit, there are but few well fupported ballets. Dance is introduced for the mere puipofe of dancing: the end is fuppofed to be anfwered by the mechanical motions of the feet, or by high jumping, and that the idea which people of real talle may have of a ballet is fully anfwered, when inactive pefformers are introduced in it, who mix and jotle each other, prefenting a confufed heap of pictures, Retched with. out tatte, aukwardly grouped, and totally devoid of that harmony and expreffion, the offspring of the foul, which alone can embellifh art by giving it life."
M. Noverre, in confidering the knowledge neceffary for attaining perfection in the prefent as, oblerves, that mythology, ancient poetry, and chronology, ought to tee the primary tudice of a ballei-mater; who mght alfo to poffefs a senius for poctry and painting, fince the art borrows all its charmo from a perfect imitation of nature.

A tlight knowledge of geometry cannot but prove very advantageons, as it will help the matter to introduce lios figutes in due proportion, to calculate exact1y, and exceute with precifion. By means of that unearing guide, be will retrench every fuperfluous accef. fary, and thus enliven the performance. Tatte will in. truduce degance, genius create variety, and judgmen: dirset the while.

Whet is a ballet but a piece of more or hefs comylieated machiney, which thikes or furprifes the behulder by its various effecta, only in propurtion as thufe are diverlified and fudden? That chain and connection of byures, thofe motions fucceeding each other with rapidity, thufe various forms turning eontrary ways, that mixume of different incioe ts, the enfumble and larmony which mark the feps and accomany the exertions of the dancers; do not ell thefe give you the ida of a mechaniom molt ingenioully comtrived?

Billets are often buit on preternatural fubjects: feveral of then require the affittence of machnery. For in fance, Sew of the luhizets taken from Ovid wh be fit for reprefentation, without a change of fcenery, fights through the air, metanorphofes, \&c. This author therfore mult never be taken for a model, unlefs the ballec-maner himflef be an expert mechanit. None are to be found our of the capita! but journeymen and thaye flutepers, whom the patronage of fone mighty fon of the lock hav peferred by degrees to that cmployment. The talents of thofe uplants confir in, and reach not beyond, the capacity of putting up the lights which they were wom to fouff for many years, or letting down auk wardly a glory of the mof wretch. ed itgle. The theatres in Italy are not remarkable for their machinery; thofe of Cermany, built upan the fame plan, are hot his deficient in piat of that enchaoting part of Auge-sxhibition; fo that a ballet-. mafter mur, in thefe countrics, tiod himfelf greaty. embarrafed, if unfilled in the mechanical arts, he. cannot convey hes ideas with perficuity, by building. for that purpofe fonall models, which are bester usderftood by the generality of workmen than the cleareft vental exflanation.

The thatate of Paris and Londmare the bef fupplide whith te refources. The $E$ glifh are very ingenions: Hacirlage machincry is refm:lified than the Fiench; and of courfe produec a quicker tfect,

Dance. Amonglt them all thefe kinds of works are moft exquifitely finifued ; that neatnefa, cate, and cxactitude, which is remarkable throughout every part, greatly contribute to the precifion of the whole. Thofe chefd'euvres of mechanifm particularly dipplay themfelves in their pantomimes; which, however, are low and trivial, devoid of tafte and interet, and built upon the meanest incidents. It may be faid that this kind of chientainment, which is got up at a prodigious ex. pence, is only calculated to pleafe tho feres which are thocked at nothing; and that it would mect with no fuccefs on the French theatres, where no other pleafantry is permitted but fuch as is not incompatible with decency, abounds with delicacy and wit, and is no ways levelled againt morals and humanity.

A compofer who wifhes to 1 ife fuperior to the grenerality of ballet-matters, thould fudy the painters, and trace them in their various manners of drawing and compofing. Both auts have the fame object in view, whether is be for taking likenefles, mixing the colours, and prelerving the clare-obleure; or for grouping the figures properly, laying on the draperies, throwing the former into elegant attitudes, and griving them life and expreffion.

Upon the fame principle, the knowldede of anatomy will lerve to render more ciear and intelligible the precepts which he has to lay down for his pupils. It will be an eafy matter for him to diftinguif properly between the natural and habitual defects in their conformation. Thele art the greatelt obllacles that fo often impede the progreds of young beginners. 'Thus once knowing the caule, he will be able to remedy the evil; as his leffon and precepts will then be the refult of thrict atiention, they never can fail of becoming profitable.

Drawing is too ufeful in the compoficion of ballets for the malter not to pay a ferions attention to that art: it will contribute to the beauty of the forms; it will give to the figures an air of novelty and elegance, gnimate the groups, throw the body into graceful pofitions, and fow the attitudes in a juit precifion.

A ballet-mater who is-no proficient in mulic, will make a bad choice of his airs. He will not enter into the firit or character of them. The motions of his dancers will not beat time with that precition and de. licacy which are abfolutely neceflary, unlefs he is endued with that fendibility of organ which is more commonly the gift of natue than the refrite of art, and is far above what may be acquired by long practice and fleady application.

A good choice of mulic is as effential to dancing as the choice of words and the phraling of a peech is to eloquence. It is the tune and time of the mufic that fix and determine the motions of the dancers. If the former be uniform and devoid of tafte, the bal. let will, like its model, be dull and unmeaning.

By this immediate connection between mufic and dancing, it clearly appears, that, from a practical know!edge of the former, the ballet-matter will derive the greateft advantages. He will then be able to impart his thouglte to the compoler ; and if tatte and knowledge combine together, he will cithor fet the mufic himielf, or at leaft furnifh the compofer with the principal ontlines, to eharacterife the action of the dancer; as this will be varied and eapref-
five, the ballet canmot fail of being equally fo. Mufic well comporca hoould paint ith jpak; and the dance fet to thofe founds, will be, as it were, the echo to repeat the words. If on the contraty it be mute, if it fpeak not to the ear of the dancer, thea all fentiment and expreffion are banified from the performe ance.

As nothing can appear trifling to the main of genius, nothing hould leem fo to the ballutemater. It is impoltible for him to diflinguith himfele in his pro. feffion, unlefs he applies to ttudy thofe arts which thave been juft mentionch. Yet to infitt that he thould be matter of them all in that degree of penfection which is attainable only by thofe who give themfelves entirely up to the Audy of each of them in parsicular, would be requiring a mere impoffibility.

All that can be deemed ftrictly requifite, therefore, is a general knowledge, a flight timoture of thof fciences which, by the connection they have with each other, are likely to contribute to the improvement of the art and to its reputation. From the natural union, however, that fubifits between the arte, and from the hamony wheh reigns amongt them, that ballet-matter will emmoble his compofition with the mott fire, fpirit, Livelinefs, and interelt, who has moll genius and imarination, and whole knowledge is mott extenlive.

As to performers, and their perfonal qualifeations: The firt point to which it is directed to paty attention when one takes up the profefion of a dancer (at leatt fo foon as he becomes capable of reflection), is his bodily formation: If one is confeious of any natural defects which feem irremediable by art, it will b= bett immediately to renounce every idea that may have been formed of the advantage ariling from popular approbation. But where perfonal defects can be reformed by application, fudy, or the advice and affltance of judicious matlers, then it becomes an effential concern quickly to exert every effort, before the parts to be corrected have acquired ilrength and confittence, before nature has unaltcrably taken her bent, and the error becomes too loabitual and invetcrate.

Among other perfonal defects, there are two which deferve particular notice: The firlt is that of being jarret," "knock-knee'd;" the other of being arque or "bow-legg'd."

A man is faid to be jurretio or in-knee'd when the haunches are thatit, and incline inwardly, the thighs lie ntar, and the knees are protuberant, and fo clofe that they rouch and knock together at every ftep even when the feet are at a distance; fo that fuch a perfon, from the knees to the feet, makes the figure of a triangle : in people of this formation, likewife, there is a clumbinefs in the infide of the ancle, a great elevation in the indtep, while the tendo Achillis is not only very flender, but much exteaded in the articulation.

The other defect, of being arque or bow-lerged, is the oppolite of the former; and exifs in the fame parts, namely, from the haunches to the feet, which deferite a fort of bow or areh; for the hanches being in this cale hollow, the thighs and knees itand open, and at a diflance, and produce the fame effect in the lower extremitics, fo that they can never be brought in proper contact like thofe of a well-haped perfon; 4. $P^{2}=$
their
D.en. their form ane lone and fat, the ancle juts out, and the formo Alviais is large and clofely inferted. A Combe wewtheic dianctrically oppotite defects, prove mone fusiby than any arguments, that the initructions which wighe corredt the earors of one of thote furt of cancer, would tent only to inereate the defices of the other; and that confequently their aim and firdy ought to be correfondently oppolite.

The dameer whole defect is of the tirlt kind, that of heing jerrete, muth ufe the meats which art furnithes hinn with, to ieparate and widen the too chotely conneated parts. The firte Atrp to this end is to turn the thighs outwardy, endeavoning to move them in that pofition, by taking the adrantage of the free sotation which the thioh-bone has in the cotilnial cavisy of the hounches: affled be this serciti, the knees will follow the fame direction, and return as it were to their proper polition. The kneepan (which feems intended to prevent the knee from being threwn too far backward from its infertion) will thad perpendiendar over the point of the foot, while the thigh and leg thus placed deferibe a line that will enfure dimmels and thability to the whole body.

The fecond remedy to be ufed is, to leep the knees in a confant bend, and to make them appear rery much fretehed, without their being rea!ly fo . This mut le the refult of long and conflant practice ; but when the habit is fronly contracted, it is impofible to return to the former vicious pestion, without cauling an ir. Gupportable pain and numbuefs. Sume dancers have lect able to conceal this defect fo artululy, that it was ratiely uadifcoverable unlefs in dancing ftrait-capers ( $\because$ in vely quick movements. The reafon of its becoming sibble at fuch times is, that the contraction of the mufcles in the effort of leaping makes them ftif about the articulation, and forces every part into its former and natural fituation; the knees thus ftrained, turn inwardly and (for the time) regain their ufual protuberance, which becomes an obftacle to the clifplay. of the entre-chat. The more thefe parts connect, to the greater ditance will the lower extremities be thrown ; hence the legs, neither being able to beat nor crofs, remain motionlefs at the time of the knees rolling over rach other, while the entre-chat, being neither cut, beat, nor croffed by the feet, is deprived of that life and brilliancy which are its chief nerit.

A perfon thus formed, fhould entirely renounce the mene-chat, cabrious, and every kind of dance that requires very quick and complicated movements, as it will infallibly render him weak and powertefs; for the haunches being fo ttrait, the mufeles that are attached to them (whereon the motions of the trunk depend): hove not a proper and eafy play, which will be always in proportion to the dimenfion of thefe bones, becaufe then the mufcles thoot out or divide from a point more slifanced from the centre of gravity: therefore the grander fort of dancing, and terre it terre, is the beat adapted to fuch daneers; and we may add, that whatever they lofe on the fore of Arength, they regain in slegance and addrefs They are luxuriant and mining in the fimplelt parts; eafy, even in difficult ones, where no great cfforts are required; juft in their execution ; elegant in their difplay; and their fpring is always sxerted with an infinity of grace, as they dexteroufly employ every refource which the motion of the inftep
can give them. Thele are adrantages which atone for wout of perfonal ftrength : and in dancing agility and addrefs are always preferable to the mere effoits of force.

The art of concealing or overcoming the defect of fuch performers as we have characterized by being afopu' or bow-legged, is in a great meafure the oppofite of the former ; namely, by endeavouring to brmes together the parts that are too much feparated, and leffening that vacancy which is particularly oblersable between the knees. Thefe require no lels exercile than the former in turning the thighs outwardly, and generally are lefs able to difguif: their fanlis: for being more robult and vigorous, there is leds pliability in their mufcles, and their juinte move lefa cadily. Aud it mult be added, if the deformity refulis from a natural difortion of the bone, latour will be as ufelets as all the aids of art will be impotent.

It was remarked, that dancers of the fult clafs, or $j$ orrete, fhould preferve a hight genublexion or bend in their performance; while thefe, for the oppolite rea. fon, ought to keep their himbs rather extended or ftretched, and to crols more clefely, by that neans diminilhing the vaeancy occaloned by the natural fepuation. Such dancers are nervous, lively, and brilliant in all cales which requirc more itrength than clegance; vigour and agility may be inferred from their mufcular foree, and the firmnefs and refiftance of their articular ligaments; lively in their dancing, becaule they crofs low rather than high ; and requiring on that account lefs face in beating time, they perform it with more livelinels: they difplay more br:lliancy, becaufe the light becomes vifible between the limbs at the moment of crofling and recroffing ; and this is precifely the chair-clfare of dancing; for if the tinte in the entre-chat or crofs-caper is neicher cut nor beat, but rollecl or huddled over, there is no light to give diftinction to the fhadow, and the limbs, fo clofely joined, prefent an indiftinet and eflectlefs mars.

Thefe dancers have lefs addrefs than the others, as they generally depend on their flrength; and indect that drength is a conitant cintaele to eale and pliancy; if it forfakes them a fingle moment, they appear aukward and ridiculous : nor can they conceal their fituation by any trifing difplay; that requiring mere addrefs, would give them time to recover, which their want of natural elafticity otherwife prevents.

Dancers who are jarretés, are weak, flender, and delicate; the others, Atrong and vigorous, large made; and neryous. It is a common opinion, that Itout, fquat-built men, are heavy and nuggifh; which they doubtlefs are in refpect of bodily weight: but the notion is erroneous fo far as regards dancing; for activity owes its very exitence to mufeular firength, and every man who has not a requifite thare of that will always fall heavy. The reafon is evident; the weak parts, in the inftant of falling, not being able to refilt the ftronger (that is, the weight of the body, which acquires a monentum in proportion to the height it falls or defcends from), yield and bend; and it is at. the moment of relaxation or flexion that the noife of the fall is heard; a circumftanee greatly leffened, or rather entirely avoided, when the body is able to maintain itfelf in a perpendicular direction; and while the mulcular fring is fufficient to oppofe that defeending
force,

Dance. forec, and vigoroufly refilt a fhock which wouid etherwite deltroy it.

Nature has not exempted the fair fex fom thafe imperfections we have been taking notice of: but art, and the ufe of petticoats, come fortunately to the help of the female dancer. The hoop conceals a multitude of defecte, which the critic's curions eye cannot afcend to difcover. Molt of then dance with their knees open, as if they were maturally aryues; but, thanks to this Lad hatbit, dud to the petticoats, they appear more beilliant than the men; becaufe, as they beat from the lower part of the ley, they perform the time quicker than we, who, concealing nuthing from the fectator, are obliged to beat at a greater extent, and to co it miginally from the hauch.
The vivacity of the fex contributes much to the brilliancy of their execntion; though certainly not lefs is owing to the petticoars, which, by cuncealing the leugth of the limbs, catch the attention, and fix it more advantagevofly: thus all the fire of the beats being united in one point, appears more lively and billitant; white the eyc embraces one object only, withut being harried and confufed, in proportion to the fpace it has to overlook.

To perfection in dancing, Mr Noverre abferves, nothing is more neceflary than the outward turn of the thigh; yet nothing is more natural to mankind than the contrary polition: it is born with us. It will be freperfluous, in eftablifing this truth, to cite for ex. ample the Afaties, the Africans, or any people who dace, or rather leap and move, without art or principle. If we attend only to children, or the rutic inhabitants of the villages, we fhall fee that they all turn their feet invardly. The other pofition is purely invention; and a proof, far from equivocal, of this fault being au imaginary one, is, that a painter woud tranfgrefs as much againl nature as the rules of his art, were he to place the feet of his portrait in the fituation of a dancer's. It is plain, then, that to dance elegantly, walk gracefully, or addrefs ourfulves with eafe and manlinefs, we mutt abfolutely reverfe the nature of things; and force our limbs, by artificial applications equally tedious and painful, to aflume a very dificrent fituation from what they origiually received.

Such a change, however necelfary in this art, can only be accomplithed by laying its fomndation in the earlieft fages of infan:y, when every bone and mauscle is in a tlate of phiability, and capable of receiving any direction which we choofe to give them.

The difficulty of attaining the outward pofftion of the limbs is owing to our ignorance of the proper ariz to be enplojed. Molt beginners perfuade thenfelves that it is to be acquired by forcing the fect to turn outward; and though this part may readily take fuch a direction, from their fupplenefs, and being fo eatily moved at their articulation with the leg ; yot this method is fo iarfalf, as it tends to difplace the ancle-bones, and befides has not any effect upon either the kuees or thighs.

Neither is it poffible to throw the knees outwardly without the affilance of the thigh. The knees have only two motions, bending and extenfion; the one drawing the leg backward, the other throwing it forward: they have no power, therefore, of themfelves to determine or affume an outward poftion; but mult
eventualy depent on the thinh, whith entircly consmands all the lower parts of the body, and turns them in confecqualace of its own rotatory motion; fo that, in fact, whatever notion or pofition that takes, the kuce, foot, and leg, are obliged to follow.
M. Nouverre condemns the courno-hunurh as a clumfy and ufelefs invention, which, inflead of producing any good effect, ferves only to lame thofe who ufe it, by giving a diftortion to the waist, much more difagrecable than what it was intended tu renove.

The finpleft and mofl natural means are thefe which reafon and good tenfe onght to adopt; and of thefe a moderate but continual exercire is indifpenfable: the. practice of a circular motion or turning of the legs, both invardly and outwardly, and of boldly beating at fu'l extent from the haunch, is the only certain exercife to be prefored. It infenfibly gives frecton, fpring, and pliancy; while the motions acquired by ufing the machine have more an air of contraint, than of that liberty and eafe which fhould frine confipicuous in them.

It has been naintained, that a $\mathfrak{f t r o n g}$ and vigorous perfon ought to fipring higher and better than a fender or weaker man. Buc experience (fays M. Noverre) daily proves the contrary. We fee many dancers, who cut the time very lrong, who beat with much vigour and firmseefs, and yet cannot fpring to any confiderable perpendicular elevatio: : for an oblique elevation, or on one fide, ought here ta be difting uiihed from the former; the latier is faint, and depends entirely upon addrefs in the dancer. There are others, again, whofe fender form renders their exceution lefo bold, and rather elegant than foreible, rather lively than nervous, but who can rife to an extraordinary height: it is to the flape and formation of the foot, and to the length and elaficity of the tendon, that this power of elevation is originally owing; the knees, the loins, and the arms, all co-nperate in this action; the fronger the prefiure upon the mufcles, the greater is the re-action, and the fpring or leap is proportionably high. The alten mate motion of the knees participate with thofe of the inflep and tendo dhillis, though the latter are fill the molt cfential ausiliaries; the maifles of the trunk lend their affiltance, and preferve the body in a perpendicular direction; while the arms, running impercepribly to the mutual affiftance of all the parto, ferve as wing to counterbalance the machine.

Obierve all thofe animala that have long and flender ancles, as Itags, rocbucks, fheep, cats, monkeys, \&c. and you will perceive that they have a quicknefs and facility of fpringing and leaping, which animals differently formed in that part can never obtain.

But were a man endowed with all the other qualities effential to the perfection of the art, yet llill withont Arength and firmnefs in his loins he never can be a good dancer. This thrength is certainly the gift of nature ; but it may be much improved by the affidnity of an able teacher. We daity fee daneers who have neither perpendicularity nor firmnefs, and whofe p-rformance is altogether unftable and irregular: and we likewife fee others, who, though they poffefs not is. great a degree of native force, have all the appearance. of linewy firmucfs and mufcular ftrength, in thes: haunches, back, and loins. Art has furnifhed a fuh. ditute for nature, in the lefions of fome excellent

Dance. teacher, who has convinced them, that when once they forego an aitention to the loins, it is impomble to keep themfelves in a right perpendicular line ; and therefore all their exertions will be devoid of tafte: that all wavering and inflability in this part is inconfiftent with perpendicularity and firmofs, ard will certainly caule diftortion of the thape and waif : that the depreffure and linking of the body deprives the lower parts of that liberty which is neceffary to their eafy motion: that hence the body is undetermined in its politions; frequently drags the limbs; and conftanly lofes the centre of gravity ; and therefore cannor recover an equilibrium, but after various efforts and contortions totally repugnant to the graceful atid harmonions motions of good dancing.

Such is the performance of thofe dancers who have no ftrength in their loins, or at leaf do not exert what they poffefs. In order to dance well, the body hould be firm and Iteady; it fhould particulaly be motion. lefs and free from wavering while the legs are in exer. tion; for when the body follows the actions of the feer, it difplays as many grimaces and difurtions as the legs exceute different teps; the performance is then robbed of its eafe, uniformity, harmony, exactnefs, firmnefs, perpendicularity, and equilibrium; in a word, of all thofe bearies and graces which are fo efential to make dancing rive pleature and delirght.

Many dancers are of opirion, that to be foft and luxuriant, the knees mull be bent very low. But in this they ate moft certainly mitaken; for a more than ordinary ftxion of the knets gives rather a dynefs and infipidity to dancins; and a dancer may be very inclegant, and jerk, as it were, all his movements, as well in bending very low as in not bending at all. The reafon will appear natural and evident, when we reflect, that the time and $m$ tions of the dancer are flrictly fubordinate to the time and movements of the mutic: purluing this principle, it is not to be doutted, that when the flexion of the knees is greater than what the air or time of the dance requires, the meaiure then drawls along, languimes, and is loft. To recover and catch again the time which this unneteflary flexion had dellroyed, the extention of the knee mult be equally quick; and it is this fudden tranfition which gives fuch a harfhnefs and fterility to the execution, and renders it as difyulful as the oppolite faalt of Afifnels and infexibility.

That luxuriant foftnefs requires more to its perfecfion than merely an exact flexion and extenlion of the kness ; the fpring of the inftep mult add its afiftance, while the loins mut balance the body to preferve thefe fprings in proper bounds. It is this rare harmony of motion ( Cays M1. Novertt) which has procured the celebrated Dupre the glorious title of the God of Dance.

There are many uancers, and of an infitior clafs only, who can difplay a gireat varicty of fieps, badly enough choien to be fure, and often diplayed without either judgen+nt or talte; but it is very uncommon to find among them that exactnefs of ear (that rare but innate talent of a dancer), which gives life to and hamps a value upon fteps, and which diffufes over all their motions a fpirit that animates aud enlivens them.

There are fome ears ftupid and infenfible even to the mof limple, plain, and tribing movements; thete are
others, more cultivated or refined, that can feel and comprehend the meafure, but cannot feize its intrica-
ficult airs and movements are eafy and intejligible, and at once comprehended It is neverthelefs certain, that a dancer may liave a very perfect and nice feeling, and yet not make his feelings intelligible to the audience, if he has not the art of commanding thofe refources which depend ajon a proper exertion of the coup dipied: aukwardnels becomes rifible where the exactelt proportion was nectflary ; and every ftep which would have been becoming, and produced the happieft effect, had it been fmartly introduced at the conclufon of the meafure, will now be cold and lifelefs, if all the limbs are in motion at once. It requires more time to move the whole body than to exert any fingle member; the flexion and extenfion of the inftep is more readily and quickly made than the reciprocal motion of all the joints. This plinciple allowed, that the darcer is deAtitute of precilion, who (inppofing he polferes a mufical ear) knows not how to time his fteps; the clafticity of the inftep, and the more or lefs acsive play of the mufcles, add to the natural fenfibility of the ear, and ftamp value and brilliancy on the dance. Whe joint charms of the harmony fpringing from the movements of the mulic, and the motions of the dancer, captivate even thofe whofe eats are the mof intentible and leatt fufeeptible of mufical impretion.

There are fome countries where the inhabitants in general are endowed with this innate mulical talte. The Palatinate, Wircmberg, Saxony, Brandenhourg, Auttia, and Bohemia, fupply the orcheftres of the German princes with many excellent muficians and eminent compolers. The Germans, indeed, are born with a very lively and juft tafte for muic, and have in them the leeds of true harmony; nothing is more common than to hear coneerts, both in the ftreets and in the hups of their mechanics, performed with the greateft fill and exactne[s.

Such a nstural and native tafte for munc as we have been mentioning, is ufually accompanied by, or includes in it, a fimilar one for dancing ; they are kindred arts; the tender and harmonious accents of the one excites and produces the agreeable and exprerlive motions of the other, and their union entertains the eye and ear with animated pictures of fentiment; thefe two fenfes, argain, convey to the heart the interelting imases which affect them, while the heat, in its turn, communicates them to the mental faculty: thus the plafure tefiding from the hamony and intelligence of thele two arts, enchants the fpectator, and hlls him with the mot feducing pleafures of voluptoufnefs.

Dancing is probably no where waritel to fuch a degree as 13 the provinces of Cermany; where the well known dances of one village arc thrangers in the adjacent hamlet ; their fongs of mirth and mentiment have no lefs different airs and movers cnis, though they are all marked with that of gaicty. Their dances are plealing and engaring, becaule the offopring of limple nature; their matuons exprets joy and pleafure ; and the eractands with which the whole is performed, gives a peculiar agretablenefs to their fteps, geltures, and attitud.s. Don they foring? -a huncied perfons, aifombled round an oat, or fome ancient pitlar, feize
the time at one inflant, bound up, and defcend with the fame exactnefs. Do they wifl to mark the me, fure by a cous de-pied? -all itrike with one confent; or when they catch up their women, you fee them all in the air at an equal height, nor do they defeend but at the precife note that maks the time.

The counter-point, which is dountlefs the touchfone of a delicate ear, is to them an object of no difficulty; henec their dance is for puticularly animated, and the nicety of that organ has the effect of giving their different motions an air of gaicty and vaniety al. together exquifite.

A dancer whole ear is untund to harmony, difphys his fteps without order of regularity, ombers from his part, and parfues the meature withont being able to reach it: devoid of judgencot, has dancing hav neither fontiment nor expreffon; and the nufie which fooukd dire this motions, renulate his k, p, an guide his time, fires only to expule his imperecti ns arel infufficiency. The itudy of muthe thoud ther... ne to applicd to ecr tic puspote of obviating this cictet, and giving more denability and exactuets to the organo of bearing.

It will not be expected that we fould proceed to give a defription of all the intricacies and combina. tions of iteps that are or can be excrted in datacing ; on enlarge on the m.chanical paraculars of the att. A difertation on the latter wemld be infipid and dif gulful; for the languse of the for ad limbs is addreffed to the eyes, not the the ears: and adetail of the former would be endels, fance every daneor has his poculiar maner of joining of varging the time. It my be fuficien jutt to mution on this puint, that it is in dancing as in mutic, and wih dancers as with muli. ians: bancing does not abenond with more fundamental fleps than mulic with notes; but there ane outars, bueves, femibreves, intains, crotchete, double and treble crotchets; times to count, and meatures to follow. This mixture, however, of is frall number of fteps, and a few notes, furnihes dancers with a mul titude of connctions and a variciy of figures: tatte and geaius will always find a fource of novelty in arranging them in sifictit manners, and to exprefs warious ditas. B'ow arnd 'tigthened, or quick and precipitate fops, and the whe currfpondently varied, give hirth to this cadeln iv afty.

nancing. They inclofe them in a pair of hollow eafes, exactly fitted to them; made of very light wood, hnhed together, and buckled at the back. Thefe at once confine their brealts fo, that chey camot grow to any difguffully exuberant lioc; though, from their finoothnefs and plianey, they play fo fredy with every motion of the hody, that they do not crumb the tender texture of the theth in that part, like the itiff whalebone fays in ufe among the Europeans. The ontfide of them is fpread over with a thin plate of gold or filver, or fet with gems, if they can affore it. Another occafional ornament the dancingegirls put on, particularly when they refort to their gallants, viz. a necklace of many loofe turns, compofed of flowers frung together, winich they call mugrees, fomewhat refembling Spanifh double jeffany, but of a much frouger and more agrecable fragrant odour, and far preferable to any perfumes. "They bave nothing (fays Mir Grofe) of that naufenus boldnefs which characterifes the European proflitutes, their ayle of feduction being all foftnefs and şentlenefs."

With regard to the performances of thefe women as dancers, we have various accounts. The author of Memoirs of the late War in Afia, acquaints us, "that their atitudes as well as movements are not ungraceful. Their perfons are delicately formed, gaudily attired, and highly perfunced. By the continuation of wanton attitudes, they acquire, as they grow warm in the dance, a frantie lafcivionfnefs themfelves, and commuaicate, by a natural contagion, the molt voluptucus defires to the beholders." Mr Ivesfeems to have been very cool on this fubject. "I could not (fays he) fee any thing in their perfornance worthy of rotice. Thei: movements are more like tumbling or thowing poflures than dancing. Their drefs is thin and hight; and their hair, necks, earis, arms, writts, fingers, legs, feet, and even the toes, are covered with rings of gold and filver, made after a chumfy mauner. They wear two rings in their nofes; and by their tlaring looks and odd geiticulations, you would ather furpect them to be mad women than morris-dancers. The band of mufic that attends them is not lefs fingular in its way: it is chiefly compofed of three or four men, who hold two pieces of bell metal in their hands, with which they make an incerfant noife; another man beats what he is pleafed to call a drum ; and that they may not wazt vocal mulic to complete the band, there are always two others appointed to fing. Thefe lalt generally lay in their mouths a good loading of beetel nut before they begin ; which, after having been well chewed, tinges the faliva with fuch a rednefs, that a flranger would judge them to bleed at the mouth by too violent an exertion of their voice. Thefe gentry are called ficky tace boys, from the iwo words ticky-tare, which they contirually repeat, and chant with great velemence. The dancinggirls are fometimes made ufe of in their religious ceremonies, as when the prictls bring forth the images of their gods into the open fields on a car ormamented with hafcivious figures, thefe girls dance before the images amidta a great crowd of people; and having been felected for their fuperior beauty, are very profitable to their matters the prielts, who are faid to proflitute them to all comers."

Mr Grofe informs us, that "s thefe dances would hardly at firft aclinh with Europeange elpecially as they No 97.
are accomparied with a mulic far from delightful, confitting of little drums called sumgrons, eymba's, and a fort of fife, which make a hideous din, and are played on by men, whofe etieminacy, grimaces, and uncouth fhivelled features, all together flock the eye and torthre the ear. However, hy ufe we become reconciled to the noife, and may obferve fome not unpleafing airs, with which the dancers keep time: the words often exprefs the matter of a pantomime dance, fuch as a lover courting his millrefs; a procurefs bringing a letter, and endeavouring to feduse a womm from one gallant in favour of another; a ginl timorous and afraid of heing canglit in an intrigue. All thefe lovefeemes the girls : xecute in character dauces, and with no defpicable expreflion, if they are proficients in their art ; for then their geftures, air, and iteps, are marking and well adapted. In fome of thir dances, even in public, modely is not mueh refpected by the lafcivinus attitudes into which they throw themfelves, without expofing any nudity; being richly clad and bedecked with jewels after their manner. Bu: in pricate parties to which they are called, as in gardens, they give themfleses a greater loofe, and have dances in referse; in which, though ttill without any gicfsnefs in difcovering their bodies, they are millersics of fueb motions and lewinefs of looks and gettures as are perhaps mure provoking.

DANDELION, in botany. See Lfoxtodon.
DANDINI (Pictro), an eminent painter, was born at Flurace in 1696 , and received his firt inftracion in the art of painting from Valerio Spada, who exeelled in fmall drawings with a pen. Whilit he was under the care of that artit, he gave fuch evident proofs of a ready genius, that he was then placed as a difciple with his ancle Vincentio Dandini, a mafor of great reputation through all Italy, who had been bred up under Pietro da Cortona. He afterwarls travelled through mott of the cities of Italy, fudying the works of thofe who were moth diftinguified; and refided for a lung time at Vernice, where he copied the paintings of Titian, Tintencto, and Paolo Veronefe. He next vifited Yarma and Modena, to defign the works of Correggio ; nmitting no opporturity that might contribute to improve his hand or his judgment. When he returned to Florence, the grand duke Cofmo III. the grand duchefs Vistoria, and the prince Ferdinand, kept him perpetually employcd, in frefeo painting as well t's in oil; his fubjects heing taken not only from faered or fabulsus hiftory, but from his own invention and fancy, which frequently furnifhed him with fuch as were odd and fingular, and efpecially with whintical caricatures. He died in 1712.-This mafter had a moft extraurdinary talent for imitating the dyle of even the mott celborated ancient painiers of every fehool, particularly Titi:u, Veronefe, and Tinturetto ; and with a force and clegance, equal to his fubjects of hiftory, he painted portraits, landfcapes, architecture, Rowers, fruit, battlce, animals of all kinds, and likewife feapicces; proving himfelf an univerfal artilt, and excellent in every thing he undertook.

He had a fon, Octavio, who proved not inferior to him in any branch of his profeffion, and was an honour to his family and his country.

Dandini (Cæfare), hitory painter, was born at Florence,

Dinctry

## Danilini.

Danegelt Florence; and was the elder brother and firt inftruc-
tor of Vincentio Dandini the uncle of Pietro. This mafter had fucceflively thudied as a difciple with Cavalier Curradi, Paffignano, and Chriftofano Allori; from whom he acquired a very pleating manner of defigniug and colouring. He was extremely correct in his drawing, and finifhed his pietures highly. Several noble altar-pieces in the churches of Florence are of his hand; and one, which is in the chapel l'Annonciata, is particularly admired.

DANEGELT, an annual tax laid on the AngloSaxons, firlh of 1 s., afterwards 2 s. for every lide of land thro' the realm, for maintaining fuch a number of forces as were thought fufficient to clear the Britith feas of Danifh pirates, which heretofore greatly annojed our coalts.

Danegelt was firft impofed as a ftanding yearly tax on the whole nation, under king Ethelred, A. D. 991. That prince, fays Cambden, Britur. 142 . much diltreffed by the continual invations of the Dancs, to procure a peace, was compelled to clarge his people with heavy taxts, callul danegelt.-At firft he paid 10,000 l. then 16,0001 . then 24,0001 . after that $36,000 \mathrm{I}$. and laftly $+8,000 \mathrm{l}$.

Edward the Cunfeffor remitted this tax: William I. and II. reaffumed it occafionatly. In the reign of Henry I. it was accounted among the king's ftanding revenues; but king Stephen, on his coronation-day, abrogated it for cever.

No church or church-land paid a penny to the danegelt ; becaule, as is fet forth in an ancient Saxon law, the people of England placed more confidence in the prayers of the church than in any military defence they could make.

DANDOLO (Henry), doge of Venice, a brave admiral and politician. With a Venetian ficet he took Conftantinople in 1203 , and had the moderation to refufe to be emperor. He died in 1250 .

DANET (Peter), abbot of St Nicholas de Verdun, was one of the perfons chofen by the duke of Montaufier to write on the claflics for the ufe of the dauphin. He had a flare in Phedrus, which he publifhed with notes and explications in Latin. He alfo wrote a dictionary in Latin and French, and another in French and Latin. He died at Paris in 1709.

DANIEL, the fourth of the greater prophets, was born in Judea of the tribe of Judah, about the 25 th year of the reign of Jofiah. He was led captive to Babylon, with other young Febrew lords, after the taking of Jerufalem by Nebuchadnezzar, who took them into his fervice. That prince gave them mafters to infrues them in the langrage and fienees of the Chatdeans, and ordered them to be fed with the mot delicate viands: but they, fearing that they fhould eat meat forbidden by the law of Mofes, defired the king's offecers to allow them only pulfe. The wifdom and conduct of Daniel pleaing Nebuchadnezzar, that prince gave him feveral pofts of honour. It is commonly believed, that this prophet, when but 12 years of age, made known the innoceace of the chafte Safannah; but the learned are not agreed, that the young Daniel, who confounded the old men, was the fame with this proplset. However, he explained Nebuchadrezzar's dream of the my therious ftatue, which foretold the four great monarchies; on which aucount he was Vol. V. Part. II.
made prefeet of the province of Babylon. In the reign Dame: of Darius the king of the Medes, he refufed to adoee the golden llatue of the king, and was catt into the lions den, when thofe beafts, tho' pinched with hanger, did him no manner of hurt. And he explained the characters written on the wall of the room where Belfhazzar was featting.

It is believed that Daniel died in Chalka, and that he did not take advantage of the permifion granted by Cyrus to the Jews of returning to their own connery. St Epiphanius fays he died at Babylon; and hercin he is followed by the generality of hitorians.

The prophecies of Daniel concerming the coming of the Mefiall, and the other great crents of after-times, are fo ckar and explicit, that, as ist Jerom tells us, Porphyry objected to them, that thofe which relatei to the kings of Syria and Egypt, chap. xi. mutt lave been written after the times of Autiochus Epiphares: whereas this prophecy was tranfated into Gieck rou years before his time, and the traflation was in the hands of the Egyptians, who had no great kinduef. for the'Jews and their religion. And thote prophaccies foretelling the facceffes of Alexander, chap. viii. 5. xi. 3. were hown to Alexander by the Jews, in confequence of which they obtained feveral privileges from him; (Ant. lib. xi. c. 8.) The ftyle of Daniel is nut fo lofty and figurative as that of the other prophets; it is cledr and concife, and his narrations and defcriptions fimple and natural: in fhort, he writes more like a hitiorian than a prophet.

The Juws do not reckon Daniel among the prophets ; part of his book, that is, from the fourtl verfe of his fecond chapter to the end of the feventh chapter, was originally written in the Chaldee languace; the reaton of which was, that in that part he treats of the Chaldean or Babylonifh affairs: all the relt of the book is in Hebrew. The fix firlt chapters of the book of Daniel are a hiftory of the kings of Dabylon, and what befel the Jews under their government. In the fix lait he is altogether prophetical, foretcllims not only what thould happen to his own church and nation, but events in which foreign princes and kingdoms were concerned.

Daniel (Samud), an eminent poct and hiforiath, was born near Taunton in Somerfethire in the yeal 1562 , and educated at Oxford: but leaving that minverfity without a decree, he applied himfelf to Enghif hiftory and poetry under the patronage of the car! of Pembroke's family. He was atterwards tutor to the lady Ann Clifford; and, upon the death of Spencer, was created poet-laureat to queen Elizabeth. In king James's reign he was appointed genteman extramdinary, and afterwards one of the grooms of the pliv:chamber to the queen confurt, who took great delight in his converfation and writings. He wrote an hiftory of Eingland, feveral dramatic picees, and fome poens; and lied in 1659 ,

Daniel (Gabric), a celebrated Jefuit, and one of the bett Frenciahituniars, was born at Rovenin 1649 . He tanght police hiterature, philofophy, and divinit, among the Jefuits; and was fuperior of their houfe it Paris, where he died in 1\%28. There are a great number of his works publifhed in Preach, of whick the principal are, 1. An shitory of Firance, of which he alfo wacte an abridgrment in nine voluraes a zmu. $4 Q$ 2.2.n

## D A N <br> $\left[\begin{array}{lll}674 & ]\end{array}\right.$ <br> D A N

Damanii, 2. An Hifory of the French Militia, in 2 vols 4 to. Bante. 3.An Anfwer to the Provincial Letters. 4. A Voyage to the Woild of Defeates. 5. Letters on the Doctrines of the Theorifts, and on Probalility. 6. New difficulties relating to the knowledge of Brutes: And, 7. A theological treatife on the Efficacy of Grace.

DANMONII, an ancient Britih mation, fuppofed to have inhabited that trade of country which is now called Cornwal and Devonthire, bounded on the fontlia by the Britih Ocean, on the wett by St George's Chanmel, on the north by the Seven Sea, and on the eall by the country of the Duratrizes. Sone other Britif tribes wese alfo feated within thefe limits; as the Coffani and ORAdannii, which were probably paticular clans of the Dammonii ; and, according to Mtr Baxter, they ware the keepers of their flocks and herds. As the feveral tribes of the Danmonii fubmitted without mach refiltance to the Romans, and never juined in any revolt again't them, that poople were under no neceffity of building many forts, or kecping many carrifons in their comtry. This is the reafon why fo few Roman antiquities have been found in that country, and fo little mention is made of it and its ancient inhabitants by Roman writers. Ptoleny names a few places, both on the fea-coatts and in the inland parts of this country, which were known to, and frequented by, the Romans. The mott confiderable of thefe places are the two famous promontories of Bolerium and Ocrinum, now the Landfend and the Lizard; and the towns of Ifca Danmoniorum and Tamare, now Exeter and Saltath. As the Danmonii fubmitted fo tamely to the Romans, they might perhaps permit them to live, for fome time at leat, under their own princes and their own laws; a privilege which we know they granted to fome other Britilh Rates. In the molt perfect fate of the Roman government in Britain, the country of the Danmonii made a part of the province called Flava Cæfarienfis, and was roverned by the prefident of that province. After the departure of the Fomans, kingly government was immediately revived anonglt the Danmonii in the perfon of Vortigern, who was perhaps defcended from the race of their ansient princes, as his name fegnifies in the Britioh languare a chieftain or the head of a family.

DANTE (Aligheri), one of the fint poets of Italy, was born at Florence in 1265, of an ancient and honourat-le family. Boecacio, who lived in the fane period, has left a very curious and entertaining treatife, on the life, the fudies, and manners of this extraordinary poet; whom he regarded as his mafter, and for whofe memory he profeffed the highet veneration. This biographer relates, that Dante, before he was nine years old, conceived a paffion for the lady whom he has immortalized in his fingular poem. Her age was near his own; and her name was Beatrice, the daughter of Folco Portinari, a noble citizen of Florenee. The paffion of Dante, however, like that of his fucceffor Petrarch, feems to have been of the chafte and platonic kind, according to the account he has himfelf given of it, in one of his early productions intitled $V_{\text {ita }}$ Nuっva; a mixture of mytterions poetry and profe; in which he mentions hoth the origin of his affection and the death of his raiftrefs, who, according to Boccacio, died at the age of 24 . The farse author afferts, that Dante fell into a deep melancholy in con-
fequence of this event, from which his friends eniea. voured to raife him, by perfuading him to marriage. After fonse time he followed their advice, and repented it ; for he unfortunately made choice of a lady who bore forne refemblance to the celcbrated Xantippe. The poet, not poflefong the patience of Socrates, feparated himfelf from her with fuch vehemem expreffrons of dillike, that he never afterwards admitted her to his prefence, though the had burn him feveral children. In the early part of his life he gained fome credit in a military eharacter; d finguithing himelf by his bravery in an action where the Florentines obtained a fignal victory over the citizens of Arezzo. He became fill more emineat by the acquifition of civis honours; and at the are of 35 he refe to be one of the chicf nagitrates of Floreuce, when thete dienity was conferred by the fuarages of the pecople. Trom this exaltation the pott hinfelf dated his principal misfortmes, as alppears from the fragment of a letter quoted by Lionardo Brunis one of his early biorrat phers, where Dante feaks of hos political failure with that liberal franknefs which integroty infuires. Italy was at that time difracted by the contending factions of the Ghibcllins and the Gutphs: the latter, among whom Dante took an active part, were arain livided into the Blacks and the Whites. Dante, fors (ranvina, exerted all his infuence to anite thefe inferior parties; but his efforts were ineffertual; and he lime the misfortune to be unjully perfecuted by thofe of his own faction. A fowerfui citizen of Florence, named Corfo Donati, had taken meafures to terminate thefe inteltine broils, by introducing Charles of Valois, biother to Philip the Fair king of France. Dante, with great vehemence, oppofed this difgraecful project, and obtained tlat banilhnaent of Donati and his partizins. The exiles applied to the pope (Boniface VLIT.), and by his affitance fucceeded in their detign. Charles of Talois entered Florence in triumph, and thofe who had oppofed his admiffion were banithed in their turn. Dante had been difpatched to Rome as the ambaffador of his party ; and was returning, when he received. intelligence of the revolution in his native eity. His enemies, availing themfelves of his abfence, had procured an iniquitoos fentence agminf him, by which be was condemned to banihment, and his poffeffions were confifeated. His two enthufatic biographers, Boceacio and Manetti, exprefs the warmeft indignation againh this injultice of his country Dante, on receiving the intelligence, touk refure in Siena, and afterwards in Arezzo, where many of his party were affembled. An attempt was made to furprife the city. of Florence, by a fimall army which Dante is fup pofed to have attended : the delign mifcarried, and our poet is conjectured to have wandered to various parts of Italy, till he found a patron in the great Candella Scala, prince of Verona, whom he has celebrated in his poem. The high fpirit of Dante wats ill fuited to courtly dependence; and he is haid to have lof the favour of his Veroneze patron by the rough franknefs. of his behaviour. From Verona he retired to France, according to Manetti; and Doccacio affirms that he difputed in the theological fchools of Paris with great reputation. Bayle quetions his vifing Paris at this period of his life; and thinks it improbable, that a man, who had been ore of the chief magitrates of Florence, llould

Dante. Mould condefcend to engage in the public fquabblez of the Parifian theologifts; but the fpirit both of Dante and the times in which he lived fufficiently account for this exercile of his talentz; and his refidance in France at this feafon is confirmed by Boccacio, in his life of our poet, which Bayle fecms to have bad no opportunity of confulting.

The alection of Heary count of Lascmburgh to the empire, in Novenber 130R, afforded Dante a ${ }^{\text {roo- }}$ fuect of heing reflored to his native city, as he attached himeff to the intereft of the new emperor, in whitic fervice he is fuppofed to have writen his Latin treatife De Momarelia, in which he aficited the rights of the empire againlt the encroaclunents of the Japacy. In the year 13n, he infligated Henry to lay fiege to Florence; in which cutcuprife, fays one of the biographers, he did not appear in perfon, from motives of refpeet towards his mative city. The emperor was repulfed by the Florentines; and his death, which happened in the fucceeding year, deprived Dante of all hopes concerning re-eltablithment in Florence. After this difappointment, he is fuppofed to have paffed fome years in roving about Italy in a ftate of poverty and diftefs, till he found an honotrable eflablinment at Ravenna, under the protection of Guido Novello da Polenta, the lord of that city, who received this illuntrious exile with the mot endearing liberality, continued to protect him througla the few remaining years of his life, and extended his manificence to the athes of the poet.

Eloquence was one of the many talcnts which Dante pofiefled in an emninent degree. On this account he is faid to have been employed on fourteen different embaffies in the courfe of his life, and to have fucceeded in molt of them. His patron Guido had occafrom to try his abilities in a ferrice of this nature, und difpatched him as his ambaffador to negociate a peace with the Venetians, who were preparing for hofilities againft Ravenna. Manctti afferts that he was unable to procure a public audience at Venice, and returned to Ravema by land, from his apprehentions of the Venetian fluet; when the fatigue of his journey, and the mortification of failing in his attempt to preferve his generous pation from the impendiug danger, threw him into a fever, which terminated in death on the 14th of September 132 i . He diad, however, in the palace of his friend; and the affectionate Guido paid the moft tender regard to his memory. 'This magnificent patron (fays Boccacio) commanded the body to be adorned with poetical ornaments, and, after being carried on a bier through the Areets of Ravenua by the molt illufnious citizens, to be depolited in a marble cofin. Ife pronomaced himfelf the funcral oration, and expreficd his defign of erecting a folendid monument in honour of the deccafed: a defign which his fubliquent misfortmes rendercd him unable to accomplinh. At his requeft, many epitaphs were writter on the prect : the beft of them (fays Buceacio) by Gioranni del Virgilio of Bologna, a fanous author of that time, and the intimate frend of Dante. Borcacio then cies a few Latin verfes, not worth tranferbing, fix of which are quoted by liayle as the compofition of Dante himfelf, or the authority of Paul Jovins. In 1493 Bernardo Bembo, the father of the celebrated cardinat,
raifed a hardome monument over the refgictivi athe. Dav'r of the poet, with the following inicriftion:
eghubnti mul's coprita pewn fitu;
Omanher et callu fytendidene niter:
Ho tibi, quem in prinan he colacere, dadit.

Ecfore this period the Fiurentines lad vain'y ended voured to obtain the bones of their great poet froms the city of Ravenna. In the age of Leo X. thiny made a fecond attempt, by a folemu application to the pope, for that purpofe; and the great Michacl Argelos an enthufiatic admirer of Dante, very liberally offered to execute a magnificent monument to the poet. IVh: hopes of the Florentines were again unfuccifoful. The particulars of their lingular petition may be found in the notes to Codivi's Life of Michacel Angelo.

At what time, and in what place, he executed the great and tingular work which has sendered him immortal, lis mumerous emmentators feem unable to determine. Boccacio afferts, that he begran it in his 35th year, and had finified feven cantos of his inferno before his exile; that in the plunder of his houfe. on that crent, the beginning of his peem was fortunately preferved, bat remained for fome time neglected, till its merit being accidentally difcovered by an intelligent poet named Dino, it was fent to the marquis Marcello Malefpina, an Italian nubleman, by whon: Dante was then protected. The marquis reftored thefe loll papers to the poet, and intreated him to proceed? in a work which opened in fo promifing a manner. To this incident we are probably indebted for the porm of Dante, which he mult have continued under all the diladvantages of an unfortunate and agitated life. It does not appear at what time he completed it ; perhaps before he quitted Verona, as he dedicated the $\mathrm{P}_{\mathrm{a}}$. radife to his Veroncfe patron. The critics have varioufly accounted for his laviug called his poem Comedia. He gave it that title (faid one of his fons), becaufe it opens with diltrefs and clofes with felicity. The very high elimation in which this production was held by his country, appears from a fingular inftitution. I he republic of Elorence, in the year 1373, affigned a public tlipend to a perfon appointed to read lectures on the poem of Dante: Buccacio was the firlt perfon engaged in this office; but his death lappening in two years after his appointment, his comment extended only to the feventeen firt cantos of the lnferno. The critical differtations that have been written on Dante are almoft as numerous as thofe to which Homer has given birth; the Italian, like the Grecian, bard, has been the futiject of the lighef panegyric, and of the groffen invctive. Soltaire has fpoken of hinn with that precipitate vivacity, which fo frequently led that lively Frenchman to infult the reputation of the nobleft writers. In oue of his entertaining letters, he fays to an Italian ablué, " Je fais grand cas du courage, avee lequel vous avez ofé dire que Dante ctoit un fon, ct fon ouvrage un monftre. - Lee Dante pourra entrer dans les bibliwheques des curienx, mais it ne fera jamais lu." But more temperate and candid citics lave not been wanting to difplay the merits of this oriscinal poct. Mr Wraton has introduced into his laft volurac on Englift

Dante, poetry, a judicious and fpirited fummary of Dante's
Dartzic. performance.

Dante (John Baptif), a native of Perugia, an ex. cellent mathematician, called the now Dadalus, for the wings he made himfelf, and with which he flew feveral times over the lake 'Ihrafymenus. Exe fel' in one of his enterprifes; the iron work with which lie managed one of his wings having falled; by which accident he broke his thigh: but it was fet by the furgeons, and he wras aferwards called to Venice to profels mathematics.

DANTZIC, the capital of Polin Pruffa, ftanding ca a branch of the Vatuh, about four miles above where it falls into the Beltic; in E. Long. 18. 36. N. Iat. 54.22. This city is famons in hithory on many acconnti, particularly that of its beind furmerIy at the had of the Handatic affociation, commonly ealled the foultorions. It is large, beantiful, popalous, and rich; its houfes eencrally are five fories high; and many of it furects are planted with chef-nut-trees. Ohe of the fuburbs is called Scotland; and the Scots have great privileges in confequence of their gallant defence of the toma, under one of the family of Donglas, ween it was belieged by the Poles. It 15 faid there are upwards of 30,000 pedlars of that ination in Poland who travel on foot, and fome with three, four, or five horfes. In king Charkes II 's time they were about 53,000: in that reign Sir John Denhan and Mir Killigrew were fent to take the number of them, and to tax them by the poll, with the king of Poland's licence; which having obtained, they brought home L. 10,000 Sterling, betides their charges in the joumey. Dantzic has a tine harbour; and is ftill a mot eminent commercial city, although it feems to be fomewhat palt its meridian glory, which was probably about the time that the prdident de Thou wrote his muchetleemed Fiforia fuit'onporis, wherein, under the sar 1007 , he fo highly ctlebrates its commerce and grandeur. It is a sepubtic, claimiug a fmall adjacent territory about forty miles round it, which were under the protection of the king and the republic of Poland. Its mingitracy, and the majority of its inhabitants, are Lutherans; a'thongh the Romanits and Calvanits be Equally tolerated in it. it has 26 parifies, with many: convents and hofpitals. 'The inhathitants lave been computed to amonnt to 200,000 ; but later computations fall very condideably thont of it, as appears by its annual bill of mortality, evhibited by Ir Bufching, who tells us, that in the yoar 1752 , there cied but 286 perfons. Its own thipping is numerous; but the forcign mips confantly reforting to it ase more $\therefore$ o, whereof rola anived there in the year 1752; in which year alfo 288 Polifh vellek came dom the Tiftult, chinfy ladon with corn, for its matehlets granaties; from whence that grain is diftributed to many soregn nations, Polaud being jufly deemed the greateft magazine of corn in all Europe, and Dantzic the sreateft port for diftributing it every where: befides which, Dent: ic evports great quantitios of naval fores, and vat varicty of other aricles. 1) Bufching affirns, that it apptars from ancient recordi, as early as the year 927 , that Datzic was a large commercial sity, and hut a village or inconderable rown, as fome pretend. The inlabutats of Ibantzic hase often fomras their matters, and lase fometimes been un-
der the protection of the Englifh and Dutch; but ge-
nerally have fhown a great predilection for the kingdom and republic of Puland, as being lefs likely to rival them in their trade, or abridge them of their im manities, which reach even to the privilege of coining money. Though frongly fortified, and poffefed of 150 large brafs cannon, it could not, through its fitua. tion, ftand a regular fiege, bein furrounded with eminences. In 1734 , the inhabitant's difcovered a rena:kable attachment and fidelity towards Stanillaus king of Poland, not only when his enemies, the Ruffians, were at their gates, but even in pofiefition of the city. This city was exempted by the late king of Prahia from thofe claims which he made on the neighbouring countries; notwithfanding which, his Prullian majuly foon after thought froper to feize on the territorices belonging to Dantzic, under pretence of their having been formenly part of Polihh Pruffa. He then proceeded to poffefs himfelf of the port-dutics belong. ing to that city, and erected a cultom-houle in the harbour, where he laid arbitrary and infupportable duties upon goods exported or imported. To complete the fyitem of opprefion, cuftom-houfes were crected at the very gates of Dantzic, fo that no perfons could go in or out of the town without being learched in the fricteft manner. Such is the theatment which the city of Dantzic has received from the king of Prulha, thongh few cities have ever exifted which have been comprehended in fo many general and particular treaties, and whofe rights and hibertics have been fo frequently fecured, and guarantied by fo many great powers, and ly fuch a long and regular fucceftion of public acts, as that of Dantzic has been. In the year $178+$, it was bloceaded by his troops on various pretences ; but by the interpofition of the mprefs of Ruffia and of the ling of Poland, they were withdrawn; and a compromie having taken place, the city was relloned to its former immonities. Neverthelofs, its trade has fince been rather upon the decline, the narchants choofing to dettie where their propesty may be more fecure.

DANLBE, the larget ard mof confderable viver in Europe, rifing in the Plack Foreft, near Zunberg; and monning N. E. through Swabia by Ulm, the capital of that country : then running E. through BafLaria and Autria, pulfes by Ratibon, L'aflat, Ens, and Vienna. It then enters Hungary, and runs S. E. from Prefburg to Buda, and io on to Beigrade; after whith it divides Lithgaria from Molachia and Moldavia, difclurging itfelf by feveral channels into the Black Sea, in the province of Befurabia. Towards the month, it uas called the flem by the ancients; and it is now faid, that four of the mouths are chooked up with fand, and that there are only two remaiaing. It begins to be navigable for boats at Uim, and receives feveral large rivers as it palfes alung. It is fo deep between Buda and Belgrade, that the Turks and Chritians have had men of war uponit; and yet it is not ravigable to the Black Sea, on account of the cataracts. The Danube was generally fuppofed to be the northern boundary of the Roman empire in Europe. It was worlhipped as a deity by the Seythians.

DAPHNE, a daughter of the river Peneus by the goddets Terra, of whom A pollo became enamoured. 'This pation had beta raifed by Cupid; with

## D A P

whom Apollo, proud of his hate conquet of the ferpen: Python, had difputed the power of his darts. Daplone heard with homor the addrefes of the god, and endeavoured to remove herfelf from his importunities by flight. Anollo purfucd ber, and 10iphne, feasful of being caught, intreated the affrance of the geds, who changed her into a laurel. Apollo crowned his head with the leaves of the laurel, and for ever orderd that that tree homm be facred to his divinity. Some fay that Daphne was adnired by Leucippus, fon of © Enomatas king of Pifa, who to be in ler company difguitud his fex and attended her in the woods in the habit of a muards. Leucippus gained Daphne's checta and lowe ; but $A_{\text {pollo, who was his }}$ powerfal inal, difforeved his fex, an 1 Leucippus was killed by the companions of Diana. Daphac was alfo the name of a dangher of 'lirctias, prictefs in the temple of Delphi. Sle was confecrated to the Eervice of Apollo by the Epiguni, or acemding to others by the guddefs Tellus. She was called Si'yl on aceount of the wildnefs of her looks and exprefinus when fle delivered orackes. Her oracles were generally in verfe; and Fomer, according to fome accounts, has introduced meveh of leer puetry in his compofitions.

Dafanf (anc.gcog.), a forll village near to, or in the fuburbs of, Antiuclia of Seleucis in Syria; with a lage grove, well watered with fprings: Ia the midcle of the grove ftood the temple of Apcllo and Diana. Its extent was 80 lladia or 10 miles; the diflance from the city five miles: A place pleafant and agreeable, from the plenty of water and the temperature of the air, and its fofe brealhing brcezcs. The grove was of bay-trecs, intermixd with eyprefs; which lant multiplied fo fat, as to occupy the whole of it. Pompey gave fome land for chlarging the grove. AntioChus Epiphanes built a very laroe temple of Dapho neus Apullo. Thic place at length became fo infamoas, that perple of madity and charater avoided reforting thither: fo that Dafomi mores became proverbial.
Daphese (anc. geor.), a finall diftrict on the lake Samachonitis, in the Higher Galiler, very pleafant and plentifully watered with jprings, which feed the Lefs Gordan; wence its thane ferms to anfe, probably in imitation of that Bear Antioch of Byra on the river Orontes.
Daphex, Spurge-hutel; a gerus of the monogyna order, belonging to the uctandria clafs of pluts; and in the natural method rarking under the 3 1ft order, $V$ eptrache. There is no calys ; the corolla is quadrifid and marcefent, inciofing the thamina. The fruit is a munofpumntus berry. There are 15 fpecies; of which the following are the mof remarhable.
I. Mezeremm, the mazcreon or fpurgu-dive, is a low Geciduons furb. It is a native of Gemmany, and has becn alio difcovered in this esuntry in fome woods near Andover in Hampliax. Of this eiegant phant there are four varietics: 1. The white; 2. The pale-ted; 3. The crimfon: ard, 4. The purpleflowering.Hantuly is very lawifa of his praife of the fe Arubs. He fays, "they have each every perfection to recounmend them as fowering-fluubs. In the fint place, they are of low gruwth, feldom aifing to more then three or four fot in loight, and dierfore ane foper even for the furallef gardens. In the nest face, they
will be in bloom when few trees, efpecially of the Daphnos Shrubby tribe, prefent their honours. It will be in February, nay, fomtimes in January; then will the twigs be garnifled with Howers all around from one end to the other. Each twig has the appearance of $a$ fpike of tlowers of the moll confumate hatre; and as the leaves are not yet out, whetber you behold this tree near or at a difance, it has a molt enchanting appearance. Eut this is not all; the fontio of furching is peculiarly regaled by the fowess; their feicy fwectnets is diffuted around, and the air is perfunced with their edours to a condiderable dittance. Many fowers, deemed fweet, are not liked by all ; but the agreable inoflemive fwectnefs of the mezereon las evor delighted the fonfe of imelliner, whilf the luthe of its blow has featied the cye. Neither is this the only pleafure the tree beftows; for befides the beanty of the lavee, which come out after the flowers are fallen, and which are of a pleafant green colour and an oblong figare, it will be fall of red berries in Junc. which will continne growing thll the antumn. Of thefe berries the birds are very fond; for that whacever is delighted with thofe fouglers, fhould have a quantity of them planted all over the outfides of his wildernefs quarters."
2. Gnidium, the fax-ieaved daphene, is a bow deciduous hrub; native of Italy, Spain, and about Montpelier. This fpecies feldom grows higher than three fect. The brancles ate very flonder, and ormamented with narrow, fpear-flaped, pointed leaves, much tike thofe of the common flax. The flowersare prodaced in panicles at the ends of the branclus: They ate finall, come out in June, but are rarcly fuco ceeded by feede in England.
3. Cneorm, the fyear-lcaved daplane or creoruni, is a very low deciduous fhrub; native of Switzerland, Hungary, the Alps and Pyrenean mountains. This rifes with a flrubby, branching ittik, to about a foot or a fout and an half high. The leaves are marrow, 〔pear-fhaped, and frow irregularly on the branches. The flowers are ptoduced in clutters at the ends of the little twigs: They make their appearance in Manch. are of a purple colour, and puffetfed of a fragrance little inferior to tiat of the mezereon; but they are fildom fucceeded by feeds in Enghand.
4. Tartonraira, the oval-leaved daplme or tartonraira, a very low devidoons flumb, is a native of France and Italy. This nites with a woody Italk to the height of about two fect. The branches are numerous, itregular, tough, and covered with a light-brown-coloured bark. The leaves are ovai, very fmall, foft to the tonch, and himing. The fowers are produced in claners fom the fides of the falks: They are white, come out in Jone, and are facteded by roundin betries, which Cldom ripen in Englad. 'This fur thould have a dy fuil and a wam fuation.
5. Alpina, the alpine daphac or chametara, is a low deciduous thrub, vative of the Alps, Gelisva, Italy, and Autrit. This will grow to the height of abjut ayd. 'Jhe leaves are ipeas-flaped, obutu, and boaly valerneath. The flowers come ont in duthe from the lides of the branches, and are very fragram: They appear in March, and are fuccueded by re! baries, that ripen in september.
6. Thymbles, the mithout-kived duphe or the themela:

## 1) A P

Dithe thymelxa; a low decidnous fanb, native of Spain and the fouth of Prance. The thymelea will grow to the height of a yerd. The Atalks of this fpecies are upzight, branched, and covered with a light-bown bark. The leares are frear-fhaped, finooth, and in fome refocet refemble thofe of milk-wort. The Rowers are produecd in elufters from the fides of the falks: They are of a greenifi colour, have monethatks, appear in March, and are fueceeded by [mail yellowinh berries, which will be ripe in suguft. This fort requiecs a dry foil and a warm fituation.
7. Villofa, the hairy-leaved dapine, a vet low deciduous fhrob, native of spain and Portugal. The falles are ligneous, almut two fett high, and fend Forth branches alternately from the fides. The leaves are fpear-haped, plane, hairy on both fides, and grow
 row tubes, are finall, and make no great flow: They come ont in June, and are not fuccieded by ripe fetils in England. This fhrub, in fome lituations, retains its leaves all winter in fuch benuty as to caufe it to be ranked among the low-growing evergreens; but as in others it is fornetines flattered with the firf black winds, it is left to the gardener whether to Jace this nirub among the decidnons trecs or evergreens.
8. Laureola, the fpurge juurd or evergreen daphne; a low evergreen faruh, cemmon is fome parts of this kingdom, alfo in Swizatand and France. This thrub fellom grows more than a yard or four fect high: it fends out many branehes from the bottom, and thefe are covered with a finooth lisht-hrown bark that is very thick. The bark on the younger branches is fmoth and green; and thefe are very elofty garnihed with leares of a delightiful frong lucid green cofon: Thefe leaves fit dofe to the branches, and are produced in fuch plenty, that they have the afpearance, at a finall dillance, of cluters at the ends of the branches. They are fpear-fleped, flaining, fnooth, and thick; their edges are entire. Hanbury extols this plant with a degree of enthufiafor ; continuing, " and this is another excellent property of this tree, that it is thus poffeffed of fuch delightful leaves for its ormament. Thefe leaves, when growing under the drip of trecs, fpread open, and exhibit their green pure and untarnished, in its natural colour; when planted fingly in expoled places, they naturally turn back with a kind of twitt, and the natural green of the leaf is often alloyed with a brownifh tinge. This fhrub is alfo valuable on account of its flowers; not becaufe they make any grent how, but from their fragrance, and the time they appear; for it will be in blow the beginning of January, and will continne fo until the middle or latter end of April before the Rowers fall off; during which tine they never fall to diffufe abinad their agreeable odours, which are refrefong and inoffenfive. In the crenings efpecially, they are more than eummonly liberal ; infonuch that a few plants will often perfune the whole end of a garden; and when this happens eally, before many fowers appear, the unfitul in fowers, perceiving an uncommon fragrancy, are at once ftruck with fuprize, and immediately begin enquiring from whence it can procced. Neither are its odours confined to a garden only; but, when planted near windows, they will enter parlours, and afiond eved into bed-chambers, to the great com-
furt of the poinefor, and furprize of every frefin viti. Daphr tor." Thefe Rowers make but little thow; for they are fimall, and of a greenifh-jellow. They are produced antongit the leaves from the fides of the ilalks, in finall chuters, and will often be fo hid by them, as to be umoticed by any but the eurions. They are fucceeded by oral berrics, which are firit green, and afterwards black when ripe. Thefe berries will be in fuch plenty as to be very ornamental; but will foon be eater up by the birds; which is another good property of this tree, as it invites the different forts of whititing birds to flock where it is planted in great plentr.

Pruegration. The mezereon ripens its feeds with us, which may at any time be eafly oltained, if they are focured from birds. Previous therefore to fowing, the heathict and mont thriving trees of the white, the pale. and the deep-red forts, thould be marked out, and as from as the berries begin to alter from green, they mof be covered with nets, to fecure them from the birds, which would otherwife devour them all. The berries will be tipe in July; and due obfervance mutt be had to pick them up as they fall from the trees, and to kerp the ferts feparate. As foon as they are all fallen, or you have enough for your purpofe, they may then be fown. The beft fuil for thefe plants is a good fat black earth, fuch as is found in kitehen-gardons that have been weil manured and managec. for many years. In fach foil as this they will not only come up better, but will grow to a greater height than in any other. No particular regard need be paid to the fituation; for as this tree is a native of the northern parts of Europe, it will grow in a north border, and Rourifin there as well as in a fouth; nay, if there be any difference, the worth border is more eligible than the fouth. 'The ground being made fine, and cleared of roots of all forts, the feeds flould be fown hardly half an inch depth. The mould being riddled over thum that depth, let the heds be netted up, and they will want no other attention until the frring. Thefe feeds will fometincs renain in the ground two years; but for the mon part they come up the fpring after fowing: and the feedlings will require no other care during the fummer than weeding, and gentle watering in dry weather. After they have been in the feed-bed one year, the Arongeft may be drawa out, and planted in the nurfery, to make room for the others; though, if they do not come up very clofe, it would be as well to let them remain in the feed-bed until the fecond antumn: when they flould be takea up with care, and planted in beds at a font afiuder tach way. This will be diftance enough for thefe low-growing flrubs. Odtober is the bet month for planting them out final-$1-$; for although they will grow if removed any time between then and fpring, yet that will etramily be a more proper feafon than when they are in full blows Sueh is the culture of this thrub. The other fecies of this genus require a different management.
The fipurge harel is fropagated by feeds, in the fame manar as the common mezereon. The feeds mult be preferwed from the birds by nets, until they are ripe. Soon after, they mut be fown as is directed for the mezereon. They will often be two years before they come up; during which time, and afterwards, they may have the fame management as bas
phre. been laid down for the common mazereon until they be tinally fet out. This thrub will grow in almot any foil or fituation, but flourithes moft under the thade and drip of taller phots, giving a peculiar checrfulnefs to the bottoms of groves and chunps in winter.
All the other forts are with fome dilliculty propagated and retained. They will by no means bear removing, even wher feedmys; and if ever this is attrmpted, wot one in an hondred muab be expected, to grow. 'ithey are raifed by feeds, which we reccive from the places whiere they grow natually; and he who is defirous of having thele plants, mult manage then in the following mamer: Lit a compolt be prepared of the ic eçual divifions; one-fourth part of limerubbith; onc-fourth part of drift or fea fand ; another of fplinters of rocks, fome broad and others furaller ; and the ether part of maiden carth from a rich pafture. Let thefe be mixed all torgether, and filted into largith pots. In earth of thefe pots put a fued or two, about half an inch deep, in the finelt of the mould. We receive the feeds in the furing; fo that there is little hopes of the ir coning up until the fring following: Let, therefore, the pots be fet in the thade all the fumner, and in the autumn removed into a warm fituation, where tincy may enjoy every influence of the fun's rays all winter. in March let them be plunged into a moderate hot-bed, and the plants will foon after appear. This bed will caufe them to beftroug plants by the autumn; and when all danger of froft is over, they may be uncovered wholly, and permitted to enjoy the open air. In the autumn, they fhould be removed into the greenhoufe, or fet under an hot-bed frame all winter; and in fpring they fhould be placed where they are to continue, moulding them up the heirght of the pot; the pots being fufficiently broken to make way for their routs as they fhont, and then left to nature.- The fituation of the four tenderes forts mult be well neltered: and if it be naturally rocky, fandy, and dry, it will be the better; for in the places where they grow naturally, they ftrike into the crevices of rocks, and Homrith where there is hardly any appearance of foil.

This is one method of obtaining thefe farubs. Another way is, by fowing the feeds in the places where they are to remain. Ihe fituation and nature of the fuil flould be as near that above deferibed as poffille; and the monld fould be made fine in fome places, and a feed or two fown in each. After this, pers flowuld be fuck down on each fide of them, to direct to the places where they are fown. The exacteft care null be obferved, all fummer, to pull up the we culs as often as they appear; for if they are permitted to get flrong, and have great roots, they will pull up the feeds with them. In the fpring following, if the feeds are groad, the plants will appear. During the fummer, they flould be waterel in dry weather; and, for the firf winter or two, flould have fome furze-buhes pricked all round them, at a proper diftance, which will break the keen elge of the frofty winds, and prefecve the young plants mutil they are Arong enongh to defend themfelves.

The cneormon and the alpine chamelxa are very hardy, and will grow in the coldefl fituation ; but the other forts frould bave a warn full and a well-fheltered
fite, or they will be fubject to be deftroyed in bad weather.

Mcidicinal properhies. The root of hemezereon was long ufed in the libbun diet-dink fur vencral complaints, particularly nodes and other fymptoms retiking the nic of mercury; but with the compofition of this article we were unacquainted, till an account of it was publifhed in the Edinburgh Phydical Enays, by Dr Donald Momo of London. On chewing it a little, it proves ury pungent, and its acrimony is acevmalated about the fauces, and is very durable. It is cmployed chicfyynder the form of decuction; and it enters the ducoctun farfaparille compofitum of the London college; but it has alfo been ufed in powder combined with fome inactive one, as that of liquorice root. It is apt to occation vomiting and purging ; fo muft be begun in grain-dofes, and gradually increafeel. It is often ufefully comLined with mercury. The bark of the root contains noil acrimony, llough fome prefor the woody part. Mezereon has alfo been whed with good effects in tumors and cutaneous eruptions not venereal. The whole plant is very corrofive. Six of the berries will kill a wolf. A woman gave 12 grains of the berries to her daughter who had a quartan ague; the vomited blood, and died immediately.

DAPINEPHORIA, a fetival in honour of $A$. pollo, celebrated every ninth year by the Bocotians. It was then ufual to adorn an olive bough with garlands of laurel and other flowers, and placed on the top a brazen glube, on which were fufpended fmaller ones. In the middle was placed a number of crowns, and a globe of inferior fize, and the bottom was adorned with a faffrom-coloured gament. The globe on the top repretented the fun or Apollo. That in thre middle was an emblem of the moon, and the others of the fars. The crowns, which were 65 in numbet, reprefented the fun's annual revolution. This bough was carried in folemin proceflion by a beautiful youth of an illultrious family, and whofe parents were both living. The youth was dreffed in rich garments which reached to the ground his hair hung loofe and difhevelled, his head was covered with a golden crown, and he wore on his feet fhoes called Jpbicratikle, from Iphicrates an Athenian, who firt invented them. He was called Aarmoopas, lawelbearer; and at that time he executed the oflice of prie星 of Apollo. He was pseceded by one of his nearell relations, bearing a rod adorned with garlands, and bes. hind him followed a train of virgins with branches in their hands. In this noder the proceffion advanced as far as the temple of Apollo, fnmamed Ifmenins, where fuplicatory liymns were flung to the grod.- ' $\Gamma$ his fell val owes its origin to the following circumfance: When an oracle advifed the Eqolians, who inhabited Arne and the adjacent comentry, to abandon their ancient pofferions and go in quell of a fettlement, they invaded. the Theban territories, which at that time were pillaged by an army of Pelafrians. As the celebration of Apollu's fellival was near, hoth nations, who reli gionlly obferved it, laid afde all hotilities, and aco conding to cufom cut down laurel boughs from nowat Helicom, and in the neighbourhood of the river $M: l_{\mathrm{s}_{2}}$ and walked in proceffion in bonour of the divinity. The day that this folempity was obferved, Polematas the general of the Bootian army faw a $\mathrm{g}^{\prime} \mathrm{uth}$ i: a dream, that prefented him with a comple fuit of amonr, and
commanded

## D A R

Da;ifer commanded the Bootiars to oficr foliemn prayers to 4 Apollo, and walk in proceffiou with laurel boughs in their hands every ninth year. Three days after this dream, the Boootian general made a fally and cut off
the greateft part of the befiegers, who were compelled by this blow to relinquifh their enterprife. Polematas immediately inftituted a novennial felfival to the god, who feemed to be the patron of the Brotizns.

DAPIFER, the dignity or office of grand-matler of a princer's houfehold. This title was given by the Emperor of Conftantinople to the Czar of Ruflia as a teftimony of favour. In France the like offieer wasinfituted by Charlemagne, under the title of dafifferat; and the dignity of dapifer is fill fubfiting in Germany, the eleetor of Bavaria affuming the title of arch dapifer of the enfire, whofe office is, at the coronation of the emperor, to carry the firft dih of meat to table on horfeback.

DAPPLE-bay, in the manege: When bay horfes have marks of a dark bay, they are called dopple-bays.

Diffle.Bluck: When a black horfe has got ipots or marks more black or fhining than the rett of his fkin, he is called a dopple lacek.

DARANTASIA, (anc. geog.), cailed Forum Claudii by the Romans; a town of the Centrones in Gallia Narbonenlis, fituated between Lemineum and Augulta Pretoria. Now Mouftiers, and Mouftiers in Tarantaife, in Savoy.

DARAPTI, among logicians, one of the medes of fyllogifms of the third figure, whofe premifes are univerfal affirmatives, and the conclufion is a paticular affirmative: thus,

> Dar- Every body is divififle;
> Ap- Every body is a fubtance;
> T1, Therefore, fome fubtance is divifite.

DARDA, a town and fort of Lower Hungary, built by the Turks in 1686, and taken by the Impe rialits the next year, in whofe hands it remains. It is feated on the river Draw, 10 miles from its confluence with the Danube, and at the end of the bridge of Effeck. E. Long. 19. 10. N. Lat. $45 \cdot 45$.

DARDANELLES, two ancient and Arong cafles of Turky, one of which is in Romania, and the other in Natolia, on each fide the canal formerly called the Hell.pont. This kecps up a communication with the Arclipelago, and the Propontis or Sea of Marmora. The mouth of the canal is four miles and a half over; and the cafles were built in 1659, to fecure the Turkifh fleet from the infult; of the Venetians. The fhips that come from Conftantinople are fearelied at the cafte on the fide of Natolia, to fee what they have on board.

DARDANIA, (anc. geog.), a diltrict of Moefia Superior to the fuuth. Now the fouth part of Servia, towards the confines of Mactdonia and Illyricum. Darduni was ihe name of the people, who feem to have been defendants of the Dordani of Troas. Alfo a firall diftrict of T'rozz, along the Hellefpont, (Mela, Virgil.) -And the ancient name of Somothraciu, (Pliny); from Ditrlanus, whoo removed thither.

DARD.ANUM pfonontoriun, (Pliny): Dardaris, (Strab)): A promentory of Ticas, near A. bydos, rumaing out into the Heilefpout; with a corsnominal town at it, calted allo Darthen:s and Dowdafam: All which give na ne to the Daskinellis.

No 27.

DARDANUS, a fon of Jupiter and Eletra, who, Darda after the death of his brother Jafinn, left Samothrace his country, and paffed into AGia Minor, where he married Batia, the daughter of Teucer king of Teucria. After the deatly of his father-in-law he afcended the throne, and reigned 62 years. He built the city of Dardania, and was reekoned the founder of the kingdom of Troy. He was fucceeded by Eichthonius. According to fome, Corybas, his nephew, accompanied him to Trucria, where he introduced the worthip of Cybele. Dardanus taught his fubjects to worfhip Minerva, and he gave them two flatues of the rodleff, one of which is well known by the name of Pallulium. Aecordint to Virgil, Dirdanus was an Italian by origin.
DARE, in ichthyology, the fame with dace. See Dace.

DARES, a Phrygian, who lived during the Trojan war, in which he was engaged, and of which he wrote the hiftory in Greek. This hiftory was extant in the age of Elian; the Latin traniation, now extant, is univerlally believed to be fpurious, though it is attributed by fome to Cornelius Nepos. This tran!lation firt made its appearance A. D. 1477, at Milan. Homer fpeaks of him, 1l. 5. v. 10. and 27.

DARIC, in antiquity, a famous piece of gold, firt coined by Darius the Mede about $55^{8}$ years before Chrilt; probably during his ftay at Babylon, out of the valt quantity of gold whieh had been accumulated in the treafury. From thence it was difperfed over the eatt, and alfo into Greece; fo that the Perfian daric, wlich was alfo called fiuter, was the gold coin belt known in Athens in ancient times. According to Dr Bernard, it weighed two grains more than one of our guineas; but as it was very fine, and contained little alloy, it may be reckoncd worth about 25. of our money. Plutarch informs us, that the darics were ftemped on one fide with an areher clothed in a long robe, and crowned with a fpiked crown, holding a bow in his l ft hand and an arrow in his right; and on the other fide with the effigies of Darius. All the other pieces of gold of the fame weight and value that were coined by the fuceeeding kings, both of the Perfian and Macedonian race, were called dhrics, from Darius, in whofe reign this coin commenced. Of thefe there were whole daries and half darics; and they are called in thofe parts of Scripture written after the Babylonifh captivity, culorkonim; and by the Taimudite, dankonoth. Greaves fays that the daric is ftill found in Peria; but it is certainly very fearce, and perhaps of doubtful antiquity.

DARIEN, or the Ifhmus of Panama, is a province between South and North America, being a narrow ithenus, or neck of land, which joins thein together. It is bounded on the north by the North Sea, on the fouth by the South Sea, on the ealt by the gulph or river of Darien, and on the weat by another part of the South Sea and the province of Verayua. It lies in the form of a bow, or crefeent, about the great bay of Panama, in the South Soa; and is 300 a tailes in length and 60 in brcadth. This province is not the richelt, but is of the greatef impostance to Spain, and has ieen the fone of more attions than any cother in America. The walth of Peru is brought hisher, and from hence exported to Europe. This has induced many enterpring people to make attempts on Pa-
nama,

## $D$ A R [ 68: $] \quad \mathrm{D} A \mathrm{R}$

nams, Porto- Bello, and other towns of this province, in hopes of obtaining a rieh booty.

The Scotch got poffefion of part of this province in 1699, and attempted to form an eftablifinent which would have proved one of the mont ufeful and important that ever was projected. Of the rife, progrefs, and cataftrophe, of this well-imagined, but ill-fated, undertaking, Sir John Dalrymple, in the 2d volume of his Memoirs of Great Britain and Ireland, has given a very interefting account, authenticated in every particular by unqueftionable documents. The projector and leader of the Darien expedition was a clergyman of the name of Paterfon; who having a violent pro. penfity to fee foreign countries, he inade his profeffion the inftrument of indulging it, by going to the new weftern world, under pretence of converting the Indians to the religion of the old. In his counfes there, he became aequainted with Capt. Dampier and Mr Wafer, who afterwards publihed, the one his Voyages and the other his Travels, in the region where the feparation is narrowef between the Atlantic and the South Seas; and both of whom, particularly the firt, appear by their books to have been men of confiderable obfervation. But he got much more knowledge from men who could neither write nor read, by cultivating the acquaintance of fome of the old Buccaneers, who, after furviving their glories and their crimes, ftill, in the extremity of age and misfortune, recounted with tranfport the eafe with which they had paffed and repaffed from the one fea to the other, fometimes in hundreds ingether, and driving ftrings of mules before them loaded with the plunder of friends and of foes. Paterfon having examined the places, fatisfied himfelf, that on the Ifthmus Darien there was a tra: of country running acrofs from the Atlantic to the South Sea, which the Spaniards had never poffeffed, and inhabited by a people continually at war with them; that along the coaft, on the Atlantie fide, there lay a flring of iflands callcd the Sambaloes, uninhabited, and full of natural ftrength and forefts, from which laft circumftance one of them was called the ifland of the Pines; that the feas there were filled with turtle and the manatee or feacow ; that midway between Porto-bello and Carthagena, but near 50 leagues diftant from either, at a place called AIa, in the mouth of the river of Darien, there was a natural harbour, capable of receiving the greateft fleets, and defended from forms by other iflands which covered the mouth of it, and from enemies by a promontory which commanded the paffage, and by hidden rocks in the pafage itfelf; that on the other fide of the ithmus, and in the fame tract of country, there were natural harbours, equally capacious and well defended; that the two feas were connected by a ridge of hills, which, by their height, created a temperate climate in the midit of the mold fultry latitudes, and were fheltered by forefts, yet not rendered damp by them, becaufe the trees grew at a diftance from each other, having very little under-wood; that, contrary to the barren nature of hilly countries, the foil was of a black mould two or three feet deep, and producing fpontaneoully the fine tropical fruits and plants, and roots and herbs; that roads could be made with eafe along the ridge, by which mules, and even carriages, might pafs from the one fea to the other in the face

Vol. V. Part II.
of a day; and confequently this paffage feemed to be pointed out by the finger of nature, as a common centre, to connect together the trade and intercourfe of the nniverfe.

Paterfon knew that Kips which fretch in a ftraight line from one point to another, and with one wind, run lefs rifks, and require fewer lands, than fhips which pais through many latitudes, turn with many coafts, and require many winds; in cvidence of which, veffls of feven or eight hundred tons burden are often to be found in the South Seas, navigated by no more than eight or ten hands, becauíc thefe hands have little elfe to do than to fet their fails when they begin their voyage, and to take them in when they end it; that as foon as flhips from Britain got fo far fouth as to reach the trade-wind, which never varies, that wind would carry them to Darien, and the fame wind would carry fhips from the bay of Panama, on the oppofite fide of the ifthmus, to the Eaf-Indies; that as fonn as Thips coming from the Eat-Indies to the bay of Panama got fo far north as the latitude of 40 , to seach the wefterly winds, which, about that latitude, blow almofl as regularly from the weft as the trade winds do from the eaft, thefe winds would carry them, in the track of the Spanifh Acapulco Thips, to the coafl of Mexico; from whence the land-wind, which blows for ever fiom the north to the fouth, wuld carry them along the coaft of Mexico into the bay of Pa nama. So that in going from Britain, fhips would encounter no uncertain winds, except during their paffage fouth into the latitude of the trade wind ; in coming from India to the bay of Panama no uncertain winds, except in their paflage north to the latitude of the wefterly winds; and in going from the other fide of the ifthmus to the eaft, no uncertain wind whatfoever. -Gold was feen by Paterfon in fome places of the ithmus; and hence an ifland on the Atlantic fide was called the Golden Ifland, and a river on the fide to the South Sea was called the Golden River; but thefe were objects which he regarded not at that time, becaufe far greater were in his eye; the removing of difances, the drawing nations nearer to each other, the prefervation of the valuable lives of feamen, and the faving in freight, fo important to merclants, and in time fo im. portant to them, and to an animal whofe life is of fo fhort duration as that of inan.
By this obfcure Scotfman, a project was formed to fettle, on this neglected fpot, a great and powerful colony; not as other colonies lave for the mof part been fettled, by chance, and unprotected by the country from whence they went; but by fyflem, upon forefight, and to receive the ample protection of thofe governments to whom he was to offer his project. And certainly no greater idea has been formed fince the time of Columbus.

Paterfon's original intention was to offer his project to England, as the country which had moft intereft in it, not only from the benefit common to all nations, of fhortening the length of voyages to the Eaft Iadies, but by the effect which it would have had to conned the interefts of her European, Wef Indian, American, African, and Eaft Indian trade. But Paterfon having few acquaintance, and no protection in London, thought of drawing the public eye upon him, and ingratiating 4 R
himfilf

Darch.

Daricn. himfelf with monied men, and with great men, by affiting them to model a project, which was at that time in embryo, for erecting the Bank of England. But that happened to him which has happened to many in his fituation: the perfons to whom he applied made ufe of his ideas, took the honour of them to themfelves, were civil to him for a while, and neglected him afterwards. He therfore communicated his project of a colony only to a Rew perfous in London, and thefe few difcouraged him.

He next made offer of his project to the Dutch, the Hamburghers, and the Elector of Brandenburgh; becaule, by means of the paffage of the Rhine and Elbe through their ilates, he thought, that the grat additional quantities of Eaft Indian and American goods, which his culony would brins into Europe, would be diftributed throngh Germany. The Dutch and Hamburgh merchants, who had mof intereft in the fubject of his vilft, heard him with indifference: The Elector, who had very little intereft in it, received him with honour and kindnefs. But court-arts and fulle reports lod him even that prince's favour.

Paterfon, on his return to London, formed a friendhip with Mr Fletcher of Salton, whofe mind was inflamed with the luve of public good, and all of whofe ideas to procure it had a fublimity in them. Fletcher brought Paterfon durs to Scotland with him, prefented him to the Marquis of Tweeddale, then Miniter for Scotland; and then, with that power which a vehement fpirit alwizs poffifes over a difmident one, perfuaded the Marquis, by arguments of puthic sood, and the honour which would redound to his adminifration, to adopt the project. Lord Stair and Mr Johnton, the two lecretalies of Ate, patronifed thole atilities in Paterfon which they poffifla in themfeles: and the Lord Advocate Sir James Stuare, the fame man who had adjufted the Prince of Orange's declaration ar the Revolation, whofe fon was narried to a niece of Lord Stair, went naturally alung with his connections. Theleperfons, in June i695, procured a datute from parliament, and afterwards a chatter from the crown in terms of it, for creating a trading company to Africa and the new world, with power to plant colonies and build forts, with confent of the inhabitants, it places not poffefled by other European nations.

Paterfon, now firdiar the ground firm under him, and that he was fupported $k j$ almol all the puser and talents of his country, the character of Fietcher, aid the fanction of an act of partiament and royal charter, threw his project boldly upon the public, and opened a fubleription for a company. The fremzy of the Scots nation to fign the folemn league and covenant never exceeded the rapidity with which they ran to fublicribe to the Daiien Company. The nobility, the gentry, the merchants, the people, the royal burghs withuut the exception of one, noft of the other public bodies, fubfribed. Yuang women theew their little fortuaes into the fork, widoxs fold their jointures to get the command of money for the fame purpole. Aimoll in an intant L 400,000 were fabferibed in Scorland, altho' it be now known, that there wasect at that time above L. 500,000 of caft in the kingdom. The famous Mr Law, then a youth, afterwards confuffed, that the facility with which hef fow the paftion of fpeculation com-
municate itilf from all to all, fatisfied him of the pof. Datien. fibility of producing the fame cffict from the fame caufe, but upon a larger fcale, when the Duke of Orleans, in the year of the Miflitippi, engaged him againft his will to turn his bank into a bubsile. Paterfon's project, which had been received hy ftrangers with feals when opened to them in private, filled them with hopes when it came to them upon the wings of public fame: For Colonel Erfine, fon to Lord Cardrofs, and Mr Haldane of Gleneagles, the one a generous branch of a generous Acm , and the other a country gentleman of fortune and character, hasing been deputed to receive fubferiptions in England and on the cominent, the Engglifh fubferibed I. $300,0 c 0$, and the Dutch and Hamburghers L. 200,000 more.

In the mean time the jealuuly of trade (continues our author), which has done more mifchief to the trade of England than all other caufes put together, created an alarm in England; and the Houfes of Lords and Commons, without previous inquiry or reflection, on the 3 th of December 1695 , concurred in a joint addrefs to the King, againit the eftablifhment of the Darien Company, as detrimental to the interest of the Eall IndiaCompany. Soon after, the Commons impeached fome of their own councrymen for beins indrumental in erecting the company; and alio fome of the Scois nation, one of whom was a peer, Lord Buthaven; that is to Gay, they. arraigned the fubjects of another country for making ufe of the laws of their own. Among 600 legiactors, not one had the happy ray of genins to propofe a com. mittee of both parhiaments, to inquire into the principles and confequences of the eftablithment ; and is thife fhould, upon incuiry, be fourd, that the bencin of it Mould be commonicated, by a participation of lights, to boil natione. The King"s antwer was, "That he had been ill advifed in Scuidad." He foon after changed his Scottifh minitlers, and fent orders to hie refident at Hambureh to prefent a memorial to the fenate, in which he difowned the company and warned them againt all connettions with it. The fenate [erit the memorial to tle afiembly of merchants, Whoteturned it with the following firitedanfwer: "Wre lons upon it as a very Arange thing, that the Kine of Britain thould offer to hinder us, who are a free people, tu trade with whom we pleafe; but are amazed to think, that he would hinder us from jnining with his own fubjuets in Scotlanu, to whom he had latuly given fuch large privitzes, by fo folemn an a.et of parliament." But merchants, though mighty prone to paffion, are cafily intimisates: The Dutch, Hamburgh, and Londun merchants withdrew their fubferiptions.

The Scots, not difcouraged, were rather animated by th is opprefion: for they conversed it into a proof of the enry of the Englith, and of their confuoufnefs of the grcat acvantages which were to flow to Scoiland from the colony. The company proceeded to build fix fhips in Holland, from $3^{6}$ to 60 guns, and they engaged i2co men for the colony: anong whom were younger fous of many of the noble and moxt ancient families of Scoland, ano 60 officers who had been difbanded at the poace, who carritu with them fuch of their private men, generally raifed on their own, or the cfate's of their relations, as they knew to be faithful and trave ; and rach of theie uele Highianders. The

## D A R

with them; they fell into difeafes from bad food and Darien. from want of food. But the more generous favages, by lunting and fihhing for them, gave them that relicf which fellow Destons refured. They lingered eight months, awaitins, hut in vais, for affitance from Scotland ; and almoll all of them either died unt or quitted the fettlement. Paterfon, who had been the firtt that entered the thip at Leith, was the latt who went on board at Darien.

During the face of two years, while the eftablifhment of this culony had been in agitation, Slatin had made no complaint to England or Scotland agants it. The Darien council even averred in their papers (which are in the Advocates Library), that the right of the company was debated before the king, in prefence of the Spanifh ambaffador, before the colony lett Scotland. But now, on the 3 d of May 1696 , the Spanifh ambalfador at London prefented a memorial to the king, which complained of the fertlement at Darien as an incroachment on the rights of his matter.

The Scots, igmorant of the misfortunes of their colony, but provoked at this memorial, fent out another colony foon after of 1300 men , to fupport an eftablifhment which was now no more. But this latt expedi. tion having been more hatily prepared than the fritt, was unlucky in its paffage. One of the mips was loft at fea, many men died on fhip-board, and the relt arrived at different times, broken in their health and difpirited, when they heard the fate of thofe who had gone before them - Added to the misfortunes of the frll colony, the fecond had a misfortune peculiar to itfelf: The General Affembly of the Church of Scotland fent out four miniters, with orders, " to take charge of the fouls of the colony, and to erect a prefbytery, with a moderator, clerk, and record of pro. ceedings; to appoint ruling elders, deacons, ovedeers of the manners of the people, and affilants in the exercife of church difcipline and government, and to hold regular kirk-feffons." When they anrived, the oflicers and gentlemen were occupied in building houfes for themfelves with their own hands, hecaufe there was no help to be got from others; yet the four minifters complained grievoully that the council did not or. der houfes to be immediately built for their accommodation. They had not had the precantion to bring with them letters of recommendation fiom the direc. tors at home to the council abroad. On thefe accounts, not meeting with all the attention they expected from the higher, they paid cout to the inferior ranks of the colomifts, and by that means threw divifions ir:to the colony. They exhautted the fpirits of the people, by requiring theit attendance at fermon four or hive hours at a ttreich, relieving each other by preaching alternately, but allowing no relief to their hearers. The employment of one of the days fet alide for relisious exercife, which was a Wednefday, they divided into three parts, thankfiving, humiliation, and fupplication, in which three minitters followed each other. And as the fervice of the church of Scotland confifts of a lecture with a comment, a Sermon, two prayere, three pfalms, and a blefling, the work of that day, upon an averare of the length of the fervice of that age, conld not take up lefs than twelve hours : during which fuace of time the colony was collected, and kept clofe together in the guard-room, which was ufed as

## D A R [ 684 ] D A R

Darien. a church, in a tropical climate, and in a fickly feafon. They prefented a paper to the council, and made it public, requiring them to fet afide a day for a folemn falting and humiliation, and containing their reafons for their requifition; in which, under pretence of enumerating the fins of the people, they poured abufe on their rulers. They damped the courage of the people, by continually prefenting hell to them as the termination of life to moft men, becaufe moft men are finners. Carrying the preßyterian doctrine of predeftination to extremes, they ftopped all exertions, by howing that the confequence of themdepended not on thofe by whom they were made. They converted the numberlefs ac-
rage, often efcape that death which they feem to provoke: Captain Campbell made his $\epsilon$ fcape in his velfel, and, ftopping nowhere, arrived fafely at New York, and from thence to Scotland, where the company prefented him with a gold medal, in which his virtue was commemorated, to iuflame his family with the love of heroic actions. And the Lord Lyon King at Arme, whofe ofice it is in Scotland (and fuch offices fhould be every where) to confer badges of diltinction acconding to the rules of heraldry upon honourable actions, gave him a Highlander and an Indian for fupporters to his coat of arms.

A harder fate attended thofe whom Captain Campbell left at Darien. 'Thicy were fo weak in their health as not to be able to weigh up the anchors of the Rifing Sun, one of their hips, which carried 60 guns: But the generous Spaniards affilted them. In going out of the harbour fhe tan aground: The prey was tempting; and to obtain it, the Spaniards had only to ftanct by and look on : but fhowed that mercy to the Scots in diftrefs, which one of the countrymen of thofe Scots, General Elliot, returned to the polterity of the Spaniards at the end of the late conflagration at the fiege of Gibraltar. The Darien flips being leaky and weakly manned, were obliged in their voyage to take Thelter in different ports beionging to Spain and England. The Spaniards in the new world fhowed them kindnefs; the Englif governments thowed them none; and in one place one of their thips was feized and detained. Of thele only Captain Campbell's thip and another fmall one were faved : The Royal Sun was loft on the bar of Charleftown; and of the colony, not more than 30 , faved from war, fhipwreck, or difeale, ever faw their country again.

Paterfon, who had ftood the blow, could not ftand the reflection of misfortune. He was feized with a lunacy in his pallage home after the ruin of the firt colony; but he recovered in his own countiy, where his Spirit, fill ardent and unbroke, prefented a new plan to the company, founded on the idea of King William, that England Chould have the joint dominion of the fettlement with Scotland.

He furvived many years in Scotland, pitied, refpected, but neglected. After the union of the two king. doms, he claimed reparation of his loffes from the equi-valent-money given by England to the Darien Company, but got nothing $\&$ becaufe a grant to hin from a public fund would have been only an act of humaciiy, not a political job.

Thus ended the colony of Darien. Men look into the works of poets for fubjects of fatire; but they are more often to be found in the records of hiltory. The application of the Dutch to King William againt the Darien Company, affords the fureft of all proofs, that it was the interelt of she Britifh illands to fupport it. England, by the imprudence of ruinitg that fettlement, lof the opportunity of gaining and continuing to berfelf the greatelt commercial empire that probably ever will be upon earth. Had me treaicd with Scotland, in the hour of the diftrefs of the company, for a joint poffction of the fettlement, or adopted the union of the kingdoms, which the fovereign of both propofed to them, that poffeffion could certainly have been obtained. Had the treated with Spain to relin. quifh an imaginary right, or at leatt to give a paflage

Darien. acrofs the ifthmus, upon receiving duties fo high as to overbalance all the chance of lofs by a contraband trade, The had probably obtained either the one or the other. Had the broke with Spain for the fake of gaining by force one of thofe favours, the would have lofl far tels than the afterwards did by carrying a war into that country for many years, to force a kiug upon the Spaniards againft their will. Even a rupturc with Spain for Darien, if it had proved fuccefful, would have Enit the two nations together by the moll folid of ties, their mutual intereft : for the Englifh muft then have depended upon Spain for the fafety of their caravans by land, and the Spaniards upon England for the fafety of their fleets by fea. Spain and England would have been bound together as Portigal and England have long been; and the Spanifh treafures have faild, under the wings of Englifh navies, from the Spanifh main to Cadiz, in the fame manner as the treafures of Portugal have failed under the fame protection, facred and untouched, from the Brazils to Lifbou.

It bas been made a quefion, whether Fing Wil. liam behaved with his ordinary fincerity and fleadisefs, in the aflurances of favour which he gave more than once to the company during their dillreffes. The following anedote makes it probable, that there was a Atruggle in his breatt between the part which he was obliged to act to pleafe his Englifi and Dutch at the expence of his scots fubjects and his own feelings. A provifion thip of the firt colony, in which were 30 gentlemen pafiengers, and fome of them of noble birth, having been thipwrecked at Carthagena, the Spaniards helieving, or pretending to believe, that they were fmugglers, caft them into a dungeon and threatened them with death. The company deputed Lord Bafil Hamilton from Scotland to implore King Willian's protection for the piifoners. The king at firft refufed to fee him, becaufe he had not appeared at court when he was taft in London. Eut when that difficulty was removed by explanation, an expreffion fell from the king which flowed his fenfe of the generous conduct of another, although influenced by the Englifh and Dutch Eaft India Companies, he could not refulve to imitate it in his own. For Lurd Bafil's audience having been put off from time to time, but at laft fixed to be in the council-chamber after a council was over, the king, who had forgot the appointment, was paffing into another room, when Lord Pafli placed himfelf in the palfage, and faid, "That he came commiffioned by a great body of his majefty's fubjects to lay their misfortunes at his feet; that he had a right to be heard, and would be heard:" The king returned, liftened with patience, gave inflant orders to apply to Spain for redrefs; and then turning to thofe near him, faid, "This young man is too bold, if any man can be too bold in his country's caufe." I had this anecdote from the prefent Earl of Selkirk, grandion to Lord Eafil.

King William's defertion of a company erected upon the faith of his own charter, and the Englifh oppreffions of it, were the reafons why fo many of the Scots, during four fucceffive reigns, diniked the caufe of the Revolution and of the Union. And that diflike, joined to Englifh difcontents, brought upon both countries two rebellions, the expenditure of many millions of money, and (which is a far greater lofs) the downfal of many of their nobleft and mot ancient fami-
lics.-Sir Foln Dalrymple's Menoiers of Great Britain ana" Duri Ircland, vol. ii.

DARIL, in logic, one of the modes of fyllogitin of the fird figure, wherein the major propolition is an $u$. niverfal aftrmative, and the minor and conclution particular affirmatives: thers,

Da- Every thing that is moved, is moved by another;
RI- Some body is moved;
1, Therefore, fome body is moved by another.
DARIORIGUM (anc. geog.), a town of the Veneti in Gallia Celtica; called in the Notitia Lugdu. nenfis, Civitas Fenetum, after the manner of the luwer age. Now $l^{r}$ unhes, or $l^{\prime}$ enacs, in Brittany. W. Long, 2. 37. Lat. 47. 40.
i) ARIUS, the name of feveralkings of Perfia. See (Ki/hory of) Persia.
DARKING, a masket town of Surrey in England, fituated ten miles eatt of Guilford. The manket is noted for corn and provifions, more efpecially for fowls. W. Lohme 8. 20. N. Lata. 51. 15.

DARKNESS, the abfence, privation, or want of natural light. "Darknefs was upon the face of the deep" (Gea. i. 2.) ; that is to fay, the chaos was plup. ged in thick darknefs, becaufe hitherto the light was not created. One of the moft terrible forts of darknefs was that which Moles brought upon Egypt as a plague to the inhabitants of it. The Septuagint, our tranflation of the Bible, and indeed molt others, in explaining Mofes's account of this darknefs, render it, " a darknefs which may be felt :" and the Vulgate has it, "a palpable darknefs;" that is, a damenefs confilting of black vapours and exhalations, fo condenfed that they might be perceived by the organs of feeling or Ceeing ; but fome commentators think that this is carrying the fenfe too far, fluce in fuch a medium as this mankind could not live an hour, much lefs for the fpace of three days, as the Egyptians are faid to loave done, during the time this darknefs lailed; and therefore they imagine, that infead of a darknefs that may be felt, the Hobrew phrale may fignify a darknefs wherein men went groping and feeling about for every thing they wanted. Le Clere is of this opinion, and thinks that Philo, in his life of Mofes, undertood the paffage in its right fenfe. "For in this darknefo (hays he), whower were in bed, durft not get up; and fuch as their natural occafions compelled to get up, went feeling about by the walls, or any thing they could lay hold on, as if they had been blind." What it was that occalioned this darknefs, whether it was in the air or in the eyes ; whether it was a fufpenfion of light from the fun in that country, or a black thick vapour which totally intercepted it, there is realon to think that the defcription which the author of the book of Wifdom (xvii. 1, 2, 3, \&c.) gives u3 of their inward terrors and confternation, is not altogether conjectural, viz. that they were not only prifoners of darknefs, and fettered with the bonds of a long night, but were horribly aftonifhed likewile, and troubled with ftrange apparitions; for while over them was fpread an heavywight, they were to themfelves more grievous than darkueis.

During the laft three hours that our Saviour hanged upon the crofs, a darknefs covered the face of the earth to the great terror and amazement of the people prefent at his execution. This extraordinary alteration in

## D A S $\quad[686] \quad$ D A S

Darlington the face of nature (fays Dr Macknitht, in his Marmony of righteonfnels was withurawing his beams from the land of lfrael and from the world; not only becaufe
it was a miraculous teltimony borne by God himfelf to his innocence; buc alfo becaule it was a fit emblem of his departure and its effects, at leatt till his light Gone out anew with additional fplendor in the miniltry of his apoftles. The darknef which now covered Judea and the neighbouring countries, beginning about $n$ son and contiuuing till Jefus expired, was not the effect of an ordinary eclipfe of the fun: for that can never happen but at the new monn, whereas now it was full moon; not to mention, that the total darknefz occafioned by eclipfes of the fun never continues above twelve or fifteen minutes; wherefore it mult have been produced by the divine power, in a manner we are not able to explain. Accordingly, Loke (xxiii. 44, 45.) after relating that there was darknefs over all the earch, adds, "and the fun was darkened;" which perhaps may imply, that the darknefs of the fun did not occafion, but proceeded from, the darknefs that was over all the land. Further, the Chtiltian writer, in their molt ancient apologies to the Hea. thens, affirm, that as it was full moon at the paffover when Chrift was crucified, no fueh ecliple could happen by the courfe of nature. They obferve alfo, that it was taken notice of as a prodigy by the Heathend themfelves.

DARLINGTON, a town of the county of Durham, fituated on a flat on the river Skerne, which falls into the Tees. It is a pretty large place, has feveral ftreets, and a fpacions market-place. It gives title of earl to the Vane family. W. Long. I. 15. N. Lat. 54. 30.

DARMSTADT, a town of Germany in the circle of the Upper Rhine, and capital of the landgraviate of Heffe Darmitadt, with a handfome cattle, where its own prince generally refides. It is feated on a river of the fame name in E. Long. 8. 40. N. Lat. 49. 50.

DARNEL, in batany. See Lolium.
DARNLEY (Lord). See (Hifory of) ScotLAND.

DARTFORD, a town of the county of Kent in England, feated on the river Darent not far from its influx into the Thames. E. Long. o. 16. N. Lat. 5 I. 25.

DARTMOUTH, a fea-port town in Devonfire, feated on the river Dart, near its fall into the fea. It is a well frequented and populous place, having a com. modious harbour, and a conlilerable trade by fea. The town is large and well built ; but the Areets are narrow and bad, though all paved. It has the title of an earlum, and fends two members to parliament. W. Ling. 4. O. N. Lat. 50. 25.

DARlOS, in anatomy, one of the coats which form the ferotum. It is called the ditros mufile; but Dr Hunter fays, that no fuch mutcle can be found, and Alhius takts no notice of it in his tables.

DASYPUS, the Armanillo or Tatou, in zoolo. gy ; a genus of quadrupeds, belonging to the order of bruta. The dafypus has meither forcteeth nor dogteeth; it is covered with a hard bony thell, interfeeted with difinct moveable zones or bets: this thell covers
the head, the neck, the back, the flamks, and extends
D. fypus. even to the extremity of the tail; the only parts to which it does not extend, are the throat, the breatt, and the belly, which are covered with a whitith fkin of a coarfe grain, refembling that of a hen after the feathers are pulled oft. The thell does not confitt of one entire piece, like that of the tortoile; but is divided into feparate belts, connected to each other by membranes, which enable the animal to move it, and even to roll itlelf up like a hedge-hog. The number of thefe belts does not depend on the age of the animal, as fome have imagined; but is uniformly the fame at all times, and ferves to dikinguith the different lpecies. All the fpecies of this animal were originally natives of America: they were entirely unknown to the ancients ; and modern travellers mention them as peculiar to Mexico, Brafil, and the fouthern parts of America; though fome indeed have confounded them with two fpecies of manis or hell-lizard, which are tound in the Eaf Indies: others report that they are natives of Africa, becaufe fome of them have been tranfoorted from Brafil to the coalt of Guinea, where a fow have fince been propagated: but they were never heard of in Europe, Alia, or Africa, till after the difcovery of America.- They are all endowed with the faculty of extending and contracting their bodies, and of rolling themfelves up like a ball, but not into fo complete a fphere as the hedge-hog. They are very inoffenfive animals, excepting when they get into gardens, wiere they devour the melons, potatoes, and other roots. They walk quickly; but can hardly be faid to run or leap, fo that they feldom efcape the purfuit either of men or dogs. But nature has not left them altogether defencelefs. They dig deep holes in the earth; and feldom go ary far from their fubterraneous habitations: upon any alarm they immediately go into their holes; but, when at too great a diftance, they require but a few moments to make one. The hunters can hatdly catch them by the tail before they link their body in the ground; where they ftick fo clofe, that the tail frequently comes away and leaves the body in the earth; which obliges the hunters, when they want to take them alive and immutilated, to dilate the fides of the hole. When they are taken, and find that thete is no refource, they inflantly roll themfelves up, and will not extend their bodies unlefs they are held near a fire. When in deep holes, there is no other method of making them come ont, but by forcing in fmoke or water. They keep in their holes thriugh the day, and feldom go abroad in quelt of fubfitence but in the night. The hunters ufualiy chafe them with finall dogs, which eafily cone up with them. When the dogs are near, the creatures indatitly roll themelves up, and in this condition the hontess car:y them off. However, if they be near a precipice they often cicape both the dogs and hunters: they roll themiches up, and tumble dowa like a ball, witherr brcaking their thell, or receiving any injary. The dafypus is a very fuitiul animal : the female generally bings forth four young ones evely month; which is the reafon why the fpecies are fo numerous, unwitheanding they ate fo much fought after on aceonat of the fweetnefs of their fleth. The Indians likewife make balkets, boxes, sce of the thells which cowt their heads.

Linneus enumerates lix fpecis of dafypus, princi-

pally diftinguifhed by the number of their moveable belts. See Plate CLV.

DA'rA, among mathematicians, a term for fuch things or quantities as are given or known, in order to find other things the rehy that are maknown. Enchid ufes the word data (of which he hath a particular tract) for fuch fpaces, lines, and angles as are given in magnitude, or to which we can affign , thers equal.

From the primary ufe of the word data in mathematics, it has been tranfplanted into other arts; as philofophy, medicine, \&c. where it expreffes any quantity, which, for the fake of a prefent calculation, is taken for granted to be fuch, without requirins an immediate proof for its certainty; called alfo the given quantity, number, or power. And hence alfo fuch things as are known, from whence either in natural philofophy, the animal mechanifm, or the operation of medicines, we come to the knowledge of others unknown, are now frequently in phytical writers called data.

DATE, an addition or appendage in writings, acts, inltruments, letters, \&c. exprefling the day and month of the year when the act or letter was paffed or figned; logether with the place where the fame was done. The word is formed from the Latin datum "given," the participle of do "I give."

Our ancient deeds had no dates, but only the month and year, to fignify that they were not made in hatte, or in the fpace of a dav, but upon longer and more mature deliberation. The king's grants began with thefe words, Prefentilus $\mathcal{G}$ futuris, $\mathcal{F}$ c. but the grants of private perfons with Omnibus prafentes literas inforcturis, E®\%.

A deed is good, though it mentions no date or hath a falfe date ; or even if it hath an impoffible date, as the 3oth of February ; provided the real day of its being dated or given, that is, delivered, can be proved. Blacki. Come vol. ii. p. 304.

Date, the fruit of the great palm-tice. Sce Phoe. Nix.

DATI (Carlo), profeffor of polite learning at Florence. His native country became very famous, as well on account of his works as of the eulogies which have been bellowed on him by learned men. The chief work to which Dati applied himlelf, was Della Pistura Antica, of which he punlifed an effay in the year 1667. He died in 1675 , much lamented, as well for his humanity and amiable manners as for his parts and learning.
I)ATJSCA, in botanv: A genus of the dodecandria order, belongirg to the dioecia clalsof plants; and in the natural ricthod ranking under the 54 th order, Mifcellowes. Thee male calyx is pentaphyllous; the re is no co. rolla; the antlece are feffite, long, and 15 in number. The female calyx is bidented; no comolla; the ftyles three ; the caplule triangular, thres-horned, unibucular, pervions, polyipermena, inferior.

DATISI, in logic, a mode of fyllogifins in the third figure, wherein the major is an usiverfal atfirmative, and the rriner and conclufion particular affirmative propoftions. For example,

1) A- All who ferve God are kings;
ri- Some who lerve God are poor ;
st, Therefore, fome who are poor are kings.
DATIVE, in grammar, the third cafe in the de-
clenfion of nouns; expreffing the flate or relation of a thing to $w$ hofe profit or lofs fome other thing is referred. See Grampar.

It is called dutive, becaure ufually governed by a vert) inplying fomething to be given to fome perfore As, commoteter Socrati," "to lend to Socrates;" utilis vigulitic, " uff ful to the conmonwealth;" ferniciofus coclefie, "pernicious to the church."

III Eughith, whele we have properly no eafts, this relation is expreffed by the fign $b$, or for.

DA'l'UM, or Dates, (anc. geog.), a town of Theace, fituated between Neapolis and the iver Neftus: A colony of the Thracians, according to Euftathius; who places it on the fea-cual, near the Strymon, in a rich and fruitful foil, famous for hip-building and mines of gold; hence the proverh $\triangle u T 0 ;$ A yabur, denoting profperity and plenty, (Strabo.) Appiandefcribes it as leated on a llcep tminence, the whole of which it covered. It was taken by Plilip of Macedon, who changed its name to Philippi, being originally called Crenides on account of its fprings. It was afterwards famous for the defeat of Brutus and Caffius by Aurutus and Antony.

1) ATURA, the thoperaprle, in botany: A genus of the monogynia order, belonging to the pentandria clais of plants; and in the natural method ranking under the 28 th order, Luride. The corolla is funnelfhaped, and plaited ; the calyx tubular, angulated, and deciduous; the capfule quadrivalved. There are fix fpecies. The Atransonium, or common thorn-apple, rifes a yard high, with an erect, ftrong, round, hollow, green ftalk, branching luxuriantly, having the branches widely extended on every lide; large, oval, irrecularly-angulated, fmooth, dark-green leaves; and from the divifions of the branches, large white flowers fiugly, ficceeded by lurge, oval, prickly capfules, growing erect, commonly called thorn-apples. At night the apper leaves rife up and inclofe the Howers. The blutoms have fometimes a tinge of purple or vioket. The flowers confilt of one large, funnel fhaped petal, having a long tube, and fpreadins pentagonal kimb, fucceeded by large roundilh capfules of the fize of middling apples, clofely befet with fharp fpines, An aintment prepared from the leaves gives eafe in external inflammations and in the lirmorrobids. The feeds were lately recommended by $\mathrm{Dr}_{\mathrm{r}}$ Storck to be iaken internally in cafes of madnefs: but they feem to be a very unfafe remedy. Takenceen in a fmall dofe, they bring on a delirium, and in a large one would certainly prove fatal. Cows, horfes, fheep, and goats, refule to cat this phat.

DAUCUS, the Cazeor, in botany: A genus of the digynia order, belonging to the pentandria clafs of plants; and in the natmal method ranking under the $45^{\circ}$ horder, Uatbellote. Ihe corolla is a litde radiated, all hermaphrodite. 'The fant brifly with hort hairs. There are five fpecies; but the only one which merits atcention is the carnta or common carrot. This is fo well known as to netd no defeription. 'Ihere are fe. veral yarietiec, as the whice, the urange, and the purple carrot; but of thefe the orange carrut is the moll eftemed. It gows longer, larger, and is commonly more handifome than the others, being often 15 or is inches lung in the eatable part, and fiom two to fous in diameter at top. Carrots are propagased by feeds, which

## D A U [ 688 ] D A U

nauce, which are fown at different feafons of the year, in order to procure a fupply of young roots for the table at all times. The [eafon for fowing for the earlieft crop is foon after Chrifmas. They hould he fown in an open lituation, but near a wall; though if they are fown clofe under it they will be apt to run up to feed too faft, and give no good ronts : about eight inches dillance is the moft proper. They delight in a warm fandy foil, which fhould be light, and well ding to a gnod depth, that the roots may meet with no obftruction in running down, fo as to make them forked, and fhoot out lateral branches. This will happen efpecial. ly when the ground has been too much dunged the fame year that the feeds were fown, which will alfo oceafion them to be worm-eaten. The hairynefs of thefe feeds makes the fowing of them dificult, on account of their being fo apt to ftick together. Before fowing, therefore, they fhould be put through a fine chaff fieve; and a calm day thould be chofen for fowing them. When fown, they fhould be trod in with the feet, and the ground raked level over them. When they firlt come up they fhould be cut up to four inches diftance, and a month after this they are to be cleared again ; and if drawn while young, they are now to be left at fix inches diftance every way; if they arc to fland to grow large, they mult be feparated to ten inches diflance. The fecond feafon for fowing carrots is in February. This muft be done under a wall or hedge, on warm banks: but thofe which are to be on open large quarters fhould not be fown till the beginning of March. In July, carrots may be fown for an antumnal crop; and laftly, in the end of Auguft, for thole which are to fland the winter. Thefe late will be fit for ufe in March, before any of the fpring ones; but they are feldom fo tender or well talled. In order to preferve carrots for nfe all winter, they are to be dug up in the beginning of November, and laid in a dry place in fand ; and thefe roots being again planted in February, will ripen feeds in Augult for fucceeding crops: the longeft and ftraightelt roots are to be chofen for this purpofe.

Under the article Agriculture, no 44. we have taken notice of the good properties of carrots as a food for cattle. They have been greatly recommended as proper for fattening hogs; but from fome experiments mentioned in the Georgical Eflays, it appears, that though the bacon thus fed is of excellent quality, the feeding is confiderably dearer than that fed with peafe, pollard, \&c. In the fame effays, the following experiment is mentioned by Dr Hunter, concerning the propriety of raifing carrots for the afe of the diftiller. "In the month of October (1773), I took 24 buthels of carrots. After being waihed, topped, and tailed, I put them into a large brewing copper with four gallons of water; and covering them up with cloths to haften the maceration, I ordered a fire to be kindled underneath, which in a fhort time reduced the whole into a tender pulp. They were then put into a common fcrew-prefs, and the juice taken from them; which, logether with the liqour left in the copper, was run through a flannel bag. The juice was then returned into the copper; and as it was my defign to make it into ale, I put to it a proportionable quantity of hops. The liquor was then boiled about an hour, when it ac$\mathrm{N}^{\circ} 98$.
quired both the taite and colour of wort. It was next put into a cooler, and afterwards into the working kindly, and in all refpects was treated as ale. I allowed it to remain in the calk about four months, when I broached it, but found it of a thick, muddy appearance. I attempted to fine it, but in vain. The tafte was by no means difpleafing, as it much refembled malt liquor. My firf intention being fruitrated, I threw it into the fill, being about 40 gallons in meafure, and by two diftillations obtained four gallons of a clean proof fpirit. It had, however, contra\&ted a flavour from the hop, which thould be left out when the intention is to reduce the liquor into 〔pirit. From a grofs calculation, I am induced to think that a good acre of carrots manufactured in this manner, will leave a profit of L. 40 . after deducting the landlard's rent, cultivation, diftillation, and other incidental expences. In this calculation, I prefume that the fpirit is worth fix millings per gallon, and not excifed. An acre of barley will by no means produce fo much fpirit. A rich fandy loam is the belt land for carrots ; which, atter the crop is removed, will be in high clutivation for corn."

Attempts have alfo been made to prepare fugar from carrots, but without fuccefs; a thick fyrupy mater like treacle being only obtainable.-Raw carrots are given to children troubled with worms. They paris through moft people but little changed. - A poultice made of the roots hath been found to mitigate the pain and abate the ftench of foul and cancerous ulcers.Crickets are very fond of carrots; and are eafily deftroyed by making a palte of powdered arfenic, wheatmeal, and fcraped carrots, which muft be placed near their habitations.-By their ftrong antifeptic qualities, a marmalade made from carrots has allo been found ufeful in preventing and curing the fea-furry.-The feeds have been reckoned carminative and diuretic; and were formerly much ufed as a remedy for the flone, but are at prefent difregarded.-Carrots were firft introduced into England by the Flemings, in the reign of queen Elizabeth.

DAVENANT (Sir William), an emment poet in the 17 th century, was born at Oxford in 1606. After fome flay at the univerity, he entered into the fervice or Frances firt duchefs of Richmond, and afterward of Fulke Grevil, lord Brook; who having an excellent talte for poctry, was much charmed with him. He got great elteem by writing poems and plays; and upon the death of Ben Johnfon was created poet-laureat. He wrote his poem Goudibert at Paris. He formed a defign for carrying over a confidcrable number of artilicers, efpecialty weavers, to Virginia, by the encouragcment of Henrietta Maria, the queen-mother of England, who obtained leave for him of the king of France. But he and his company were feized by fome partiament fhips, and he carried prifoner firlt to the ifle of Wight, and then to the Tower of London; but, by the mediation of Milton and others, he got his liberty as a prifoner at large. At this time tragedies and comedies being prohibited, he contrived to fet up an 0 . pera, to be performed by declamations and mufic. This Italian opera began in Rutland-houfe in Charter-houfe-yard, 1656 ; but was afterwards removed to the

Cock.

Davenant Cock-Fit in Druy-Lane, and was much frequented Il for many years. In 1648 , his Madagafear, with other havidats. poems, were printed. He died in :668.

DAVENANT (Doctor Charles), an eminent civilian and writer, cluct fon of the preceding, and educated in Cambridge: lie wrote feveral political tract; ; and likewife plays. Fle was ( 1685 ) impoweral, with the madter of the revels, to infpect the plays defigned for the flage, that no immoralities might be prefented. His Effays on Trade are in high eftem ; and were reprinted in 5 vols. 8 vo, in 1771. Doctor Davenant was infpector-gencral of exports and imponts; and died in 1712.
DAVENTRY, or Daintry, a handfome town of Northamptonhire in England, finated on the fide of a hill on the great wad to Chefler and Carlifle. W.Long. 3. 15. N. Lit. 52. 12.

DANGHTLR, (fin), a female child. Sce the article Children.

Danghters, among the ancients, were more frequently expofed than fons, as requiring greater charge to eduatt and fettle them in the world. See lixposixe of Chitsen. Thofe who had no legitimate fons werc alliged, by the A thenian laws, to leave their eltates to the diaghater, who were confined to marry their nearef relativis, oflerwife to forfeit their inheritance; as we tend to have becn practifed likewife anong the fews, many of whofe laws tem to have been tranfurited by Solon.

If an heirefs happened to be married hefore her father's death, thi did wot hinder the neare:t relation to clain the inheritance, and even to take the woman from her hu:tband; which is faid to lave been a comnoon cale.

DAVID, king of Tfiacl, and Hebrew poet, was born at Betheth in 1085 , and died $101+$ years B. C. His hiftory is particularly re corded in the facred writims.

Sr DAVID's, an epifcopal town of Peminokefinte, in S. Wales; but has nether marhet nor fair. It is foated in a barren foil on the river flem, not a mile from the fea-fhore. It was once a confiden whe place, and had walls, which are now demuliford ; but it is inall at prefent, and thinly inhalited; however, the cathedral is a protty good fructure. From the cape, near this place, there is a profpect into Ineland. W. Long. 5. 20. N. Lat. 52. 0 .

St Datin's, a buwn and fort of Afia, in the peniafula on this the the Ganges, and on the cont of Coromandel, so miles S. of Fort St Genrge. E. L.ong. -1. 55. N. Lat. 11. 30. On the taking of Madrafs by the French in 1746 . the prefidency of all the Englith fettlements on the Coromandel coall was removed to Fort St Davil, and continued there till about the year 1752, when it was removed back to Madrafs. In June $175^{\circ}$, the fort was taken and demolithed by the French, and has never been rebuilt fince.

1) AVidists, Daridici, or Damid Grorgians, a fect of heretics, the adherents of David George, a narive of Delth, who, in 1525, began to preach a new doderine; publithing himfelf to be the true Moffiah; and that he wats fent thither to fill heaven, which was quite empty for want of people to deferve it. He is likewite faid to have denied the exillence of angels, good and evil, of hedven and hell, and to have rgieted
Vok. V. Harill.
 riage, with the Alanite; ; hel, with Minces, dedthe foul wis mot defiled by fins: and langhed at the feis. deniad fo much recommemded hy Jelus Chridt. Ench were his principal erters. Jle made his eforpe irom Delft. and retired firll into liceltand and then to ! ! fil, where he changed his name, affaming that of John Bruck, and died in $155 \%$.

He left fone difiples behind him, to whom be promifed, that he would rife again at ihe end of there years. Nor was he altugether a falle proplet herem: for the magitrates of that city, being infom at, at the thee yoars end, of what he had trught, odened! !im to be dug up and bunt, together with his writing. by the common hangman.

There are till fome rmains of this ridiculous face in Hollacin, Friefland, and other countries; whofe temper and condued feem to diferedit the exargerated accome which fome writers have given it their founder. He was probably a deluded fanatic and mytic.

DAVBi, A (Ifenry Catherinc), a celebrated hiflorinn, was the romagelt fon of Antonio Davila, grand conitable of Cypias, whe on the takiog of that illand by the Turks in 15-0, hat hern obliged in retire into Spain, whence thin famly fuppord the had deried their name and wrigia. From Spain Antonio repaired to the court of lrance, and fotuled his fone Luvis and two daughtens under the patronage of Citherine of Medicis; whole bame le afterwards gave to the young hittorian, born $157^{\circ}$, at an ancient cafle in the territories of Padua, though genemally called as native of Cypras. Tha lithe Dtria was brough cary into France: and at the age of 18 , he lignalized lime felf in the military fecues of that comatry. Ilis laf exploit there was at the here of Amiens, where he fought under Hemy 1V. and recused a wound in the knee, as he redates himfelt in his hitory. After prace was etablifined in France, he withdecw into lealy, and cutered into the fervice of the Venctians. Davila, while he was at Venice, wrote his admirable Hitory of the Cisil Wars of France, which contains every thing worth notice that pafied from the death of Henry 11 . in 1559 , to the peace of Verrins in 1598 . He con. tinad to ferve the republic of Venice with great repatation, till a mont unfortunate adventure put an end to hiskife in I63I. I'affung through Verona with his wife and family, on his way to Crema, which he was appointed to defond, and demanding, according to the ufual cuitom of perfons in his fation, a fupply of horfes and carriages for his retinue, a brutal Veronefe, called if Turce, cutcred the room where he and his family were at fupper, and being mildly reprimanded for his intrufion by Davila, difcharged a pifn at the hiftorian, and thot lim dead on the inttant. His accomplices alfo killed the chaplain of lyavila, and wounded many of his attendants. But his edelt fon Antonio, a youth of 18 , revenged the death of his father, by killing the munderas on the por. All the cunfederates were fecured next morning, and publicly execured at Verna. It is very romarkable, that Davila pated no cenfure on the maffacre of St Bartholomew. Ilis character of the queen mother has that pertialis., which it was matural for him to thow to the patronefs of his family; but his genced veracity is condirmed by $+S$
the

Davis the great authority of the filf duke of Epernon, who
II. (to ufe the words of lord Bolingbroke) "had been an Davit. actor, and a principal actor too, in many of the fcenes that Davila recites." Girard, fecretary to this duke, and no contemptible biographer, relates, that this hiItory came down to the place where the old man refided in Gafeony, a little before his death; that he read it to him; that the duke confirmed the truth of the narrations in it ; and feemed only furprifed by what means the author could be fo well informed of the mofl fecret councils and meafures of thofe times.

DAVIS (Sir Juhn), an eminent lawyer and poet, born aboat the year 1570 . He firll diftinguifhed himfelf by his proem Nefce Teipfrum on the Immurtality of the Soul. He became attorney-general, and fpeaker of the heufe of commons in Ireland; and afterward was appointed lord chief jutice of the court of King's Bench in England, but died before his inftallation, in 1625. He publifhed many law tracts; but was efleened more of a fcholar and a wit than of a lawyer.

Davis (Juln), a famous navigator in the 16 th century, was horn at Sandridge, near Daitmouth in Devonfhice; aud dititinguifhed himfelf by making three voyages to the moll northern parts of America, in order to difoner a north-weft palfage to the Ealt Indies; in which he difeovered the Straits which bear his name. He afterwards performed five voyages to the Eaft Indies; in the laft of which he was flain in a defperate fight with fome Japanf fe, near the coaft of Malacca, on the $27^{\text {th }}$ of December 1605 . He wrote an account of his fecond voyage for the difcovery of the north-welt paffage ; a Voyage to the Eall-Indies; and other tracts.

## 

DAVII', in a hip, a long beam of timber, reprefented by $a, a$, Ylate CLXV. and ufed as a crane whereby to hoilt the flukes of the anchor to the top of the bow, without injuring the fides of the thip as it afcends; an operation which, by mariners, is called fifbing the ancbor. The anchors being fituated on both the lows, the davit may be occafionally fhifted, To as to project over either fide of the fhip, according to the poffition of that anchor on which it is employed. The inaer end of the davit is fecured by being thruft into a fquare ring of iron $b$, which is bolted to the deck, and forelocked under the beams. This ring, which is called the fpan-foackle, exhibited at large by fig. 9. is fixed exactly in the middle of the deek, and clofe belind the foremail. Upon the outer end of the davit is hung a large bluck $c$, through which a ftrong rope traverfes, called the fifb-pendent, $d$; to whofe foremoft end is fitted a large iron hooke, and to its after-end a tackle or complication of pullies $f$; the former of which is called the fybshook, and the latter the fifo-tackle.

The davit, therefore, according to the fea-phrafe, is employed to folo the anchor; which being previouly catical, the fifh-hook is faftened upon its fukes; and the effort of the tackle being tranfmitted to the hook, by means of the fifh-pendent, draws up that part of the anchor fuficiently high upon the bow to fatten it, which is dune by the floank-puinter. See that article. -There is alfo a davit of a fmaller kind occafiomally
fixed in the long-boat, and employed to weigh the Dauphin. anchor therein.

DAUPHIN is a title given to the cldest fon of France, and prefumptive heir of the crown; on accomat of the province of Dauphiné, which in 1343 was given to Plilip de Valois, on this condition, by Humbert dauphin of the Viennois. The dauphin, in his letters patent, ityles himfelf, By the drace of God, ciad? fon of France, and daupbin of Viennois.

Dauphin was anciently the title or appellation of the prince of Viennois in France.

Moft authoss who have fought the origin of the name Dauphin and Daxphiné, feem to have given two much loofe to conjecture. Du-Chefne is of opinion, that it was the grandfon of Guy the Fat who firit bore the name of dutuphin. Chorier obferses, that William, canon of Nutre Dame at Grenoble, who has written the life of Nargaret, daughter of Stephen earl of Burgundy, married with Guy, fon of Guy the Fat, calls the latter fimply Guy the Old, and the furmer always count Dauphin; and adds, that no record, no moniment, ever attributes the title of dauphin to Guy the Fat or any of his predeceffors: fo that it mult necerfarily have taken its rife in his fon, all whefe fuccelfors fo conftantly affumed it, that it became the proper name of the family. He died in 1142 , in the flower of his youth; fo that it mult be about the year in zo that the title commenced; and without doubt, adds he, on fome illuftrious occafion. He obferves farther, that this prince was of a military difpofition, and delighted in nothing but war; and again, that it was the cuftom of the cavaliers to deck their calks, coats of arms, and the houfing of their horfes, with fome figure or device peculiar to themfelves, whereby they were diftinguihed from all others engaged in the fame combat or tournament. From all thefe circumftances he conjectures, that this Guy chofe the dolphin for his fignature; that this was the creft of his helmet; and that he bore it on his coat in fome notable tournament or battle, wherein he diftinguifned himfelf. And this, Chorier makes no doubt, is the real origin of the appellation. Nothing was more common in thofe times than to make proper names become the names of families or dignities. Witnefs the Ademars, Arthauds, Aynards, Atlemans, Berengers, and infinite others; who all owe their names to fome une of their anceftors, from whom it has been tranfmitted throughout the family.

The feigneurs or lords of Auvergne have likewife borne the appellation of dupbin; but the dauphins of Auvergne had it not till a good while after thofe of the Viennois, and even reccived it from them. The manner was this: Guy V1II. dauphin of Viennois, had by his wife Margaret, daughter of Stephen earl of Burgundy, a fon and two daughters. The fon was Guy IX. his fucceffor. Beatrix, one of the daughters, was marrried to the count d'Auvergne, who, according to Blondel, was William V. or rather, as Chorier and others hold, Robert VI. father of William V. This prince lolt the greateft part of the county Auvergne, which was takem from him by his uncle William, affifted by Louis the Young : and was only left mafter of the little canton whereof Vodable is the capital. Fe had a fon whom he called Dauphin, on accomat of Guy, or Guigue, his uncle by the mother's ide.

From:

Dauphin From his time his fucceffors, holding the fame petty
 canton of Auvergne, ftyled themfelves dauphins of Au vergne, and bore a dolphin fur their arms.

Dauphins, or Delphins, in literary hitory, a name given to the commentators on the ancient Latin authors, who were employed by order of Lonis XIV. of France, for the benefit of the prince, under the care and direction of M. de Montaufier his governor, Boffuet and Huet his preceptors. They were 39 in number.

DAUPHINY, a province of France, bounded on the weft by the river Rhone, on the north by the Rhone and Savoy, on the fouth by Provence, and on the ealt by the Alps. Hence the prefumptive heir of France is called the Dauphin. In fome places it is very fertile; and produces corn, wine, olives, woad, copperas, filk, cryttal, iron, and copper. But the greateft part of this province is barren, and the inhabitants are obliged to go into other countries for fubfittence. The mountains abound in timples and gane of all forts; and here are fir-trees proper for mafts. The principal rivers are, the Rhone, the Durance, the Ifere, and the Drone. There is a great number of mineral fprings; and Grenoble is the capital town.

DAURAT (Joln), an eminent French poet, born in 1507. In the reign of Henry II. he was preceptor to the king's pages, and Charles IX. who took great delight in his converfation, and honoured him with the title of his poct ; but his generefity and want of management placed him in that elafs of learned men who have been very near flarving. Conformable to the tafte of the age, he had fo much fkill in making anagrams, that feveral illuttrious perfons gave him their names to anagrammatife: he alfo undertook to explain the Centurics of Noftradamus. Making verfes was a difeafe in him: for no book was printed, nor did any perfon of confequence die, but Daurat made fome verfes on the occalion; as if he had been poet in ordinary, or his mule had been a hired mourner, to the whole kingdom. Scaliger tells us, that he fpent the latter part of his life in endeavouring to find all the bible in Homer. He died in 1588.

DAY, according to the mof natural and obvious fenfe of the word, lignifies that fpace of time during which it continues to be light; in contraditinction to night, being that partition of time wherein it is dark : but the fpace of time in which it is light, being fomewhat vague and indeterminate, the time between the rifing and the fetting of the fun is ufually looked on as the day ; and the time which laples from its fetting to its rifing again, the night.

The word day is often taken in a large fenfe, fo as to include the night alfo; or to denote the time of a whole apparent revolution of the fun round the earth; in which fenfe it is called by fome a natural day, and by others an artificial one : bot, to avoid confufion, it is ufual to call it in the furmer fenfe fimply the diay, and in the latter a nychethencron; by which term that acceptation of it is aptly denoted, as it implies both day and night.

Thee nychthemeron is divided into twenty-four parts, called bours; which are of two forts, equal and unequal or temporary. See the article lour.

Different nations bergin their day at a different hour. Thus the Egyptians beg in their day at midnight; from
whom Hippocrates introduced that way of reckoning
Day. into aftronomy, and Copernicus and others have followed him: But the greatell part of aftronomers reckon the day to begin at moon, and fo count twentyfour hours, till the noon of the next day; and not twice twelve, according to the rultrar computation. The method of beginning the day at midnight prevals alfo in Great Britain, France, Spain, and mott parts of Europe.

The Babylonians began their day at fun-rifing: reckoning the hour immediately before its rifing again, the twenty-fourth hour of the day; from whence the hours reckoned in this way are called the Batbylonic. In feveral parts of Germany, they begin their day at funfetting, and reckon on till it fets next day, calling that the twenty-fourth bour: thefe are generally termed Italian hours. The Jews alfo began their nychthemeron at fun-fetting: but then they divided it into twice twelve hours, as we do; reckoning twelve for the day, be it long or thort, and twelve for the aight; fo that their hours continually varying with the day and night, the hours of the day were longer than thofe of the night for one half year, and the contrary the other; from whence their hours are called temporary: thofe at the time of the equinoxes became equal, becaufe then thofe of the day and night are fo. The Romans alfo reckoned their hours after this manner, as do the Turks at this day.

This kind of hours is called planetary, becaufe the feven planets. were anciently looked upon as prefiding over the affairs of the woild, and to take it by torns each of thefe hours, according to the following order: Saturn firft, then Jupiter, Mars, the Sun, Venus, Mescury, and laft of all the Moon: hence they denominated cach day of the week from that planet whofe turn it was to prefide the firl hour of the aychthemeron. Thas, afligning the firtt hour of Saturday to Saturn, the fecond will fall to Jupiter, the third to Mars, and fo the twenty-fecond of the fame nychthemeron will fall to Saturn again, and therefore the twenty-thind to Jupiter, and the laft to Mars: fo that on the fift hour of the next day, it will fall to the Sun to prefide; and by the like manner of reckoning, the firit hour of the next will fall to the Moon; of the next, to Mars; of the next, to Mercury ; of the next, to Venus: bence the days of the week cance to be diftinguithed by the Latin names of Dies Saturni, Solis, Lulux, Ahurtis, Mercurii, 7 ovis, and I'cheris; and among us, by the names of Saturday, Sunday, Monday, \&c.

Dar-Coal, in natural hitory, a name given by the miners of England, and the comanon people who live in ceal-countries, to that feam or thratom of the coal which lies appermolt in the carth. The fane vein or Atratum of coal uffually suns a great way through the country, and dips and rifes in the earth at different places; fo that this apper itratum, or day-cral, is, in the variods parts of the fame Atratum, fometimes near the furface and fometimes many fathoms deep. The fibterranean fires found in fonse of our coal-countrics feed principally on this coal; and are nearer to or farther from the furface as it rifes or finks.

Dar-Ely. Sec Ephemeris.
Dar-Act, ameng fowlers. See Net.
Dars of Gruce, are thofe granted by the court at the prayer of the defendant or plaintif, in whufe delay it io.

Da; Doys of rootce, in commerce, are a culomary numIl ber of dars allowed for the payment of a bill of ex- chanse, \&ic. after the fame becomes due.
'lhree days of grace are :lllowed in Britain; ten in France and Inatric ; eight at Naples; his at Venice, Amferdam, Fotterdam, and Antwerp; four at Francfort; five in Leiplic; twelve at Hamburs ; dix in Portugal; fourteen in Spain: thirty in Genoa, \&c.

In Britain the days of grace are given and taken as a matier of comle, the bill being only paici on the lait day: but in other commtries, where the time is much lonser, it would be reckoned dihonomable for a merchant to talke admanage of it ; bills are thorefore paid on the wery day they fall due.
D.A's- FAm, in the nonth of England, an arbitrator or cefon chofon to determine an atair in dipnte.

Intercalay Dirs. Sec Intereazzry Dats.
Daz"s-lt'ork, among feamen, the reckoning or aerount of the thip's courfe during $2+$ hours, or between noon and nown, a cording to the rules of trigonometry. See DEAD-RCROM:

DAZE, in natural hifory, a name given by our miners to a glitteriner fort of itone, which often occurs in their works; and, as it is an unprofitable fubtance, is one of thow things they call wechs. "he word derae takes in with then every tome that is hard and glittring; and therefore it comprehends the whole genus of the felungia or fony nodules, which have the dukes of tatik in their fibntance: thefe, according to the colour of the fony natiter they are bedded in, and the ir own colour, give the manes of blaik daze, white, red, and yollaw daze, to thefe ilones.

DEACON. Diacones, a perfon in the loweft defree of hury orders, whofe bufinefs is to baptife, read in the church, and affift at the colebration of the eucharif. The word is formed from the Latin Diaconus, of the Predes fazovast, miniter, fervant. Deacons were infotuted feven in number, by the apoftles, Alzs chap. vi. which number was retained a long time in feveral churches. Their office was to lerve in the Agapre, and to ditribute the bread and wine to the communicants. Ancther part of the office of deacons, was to be a furt of monitors and directors to the people in the exercife of their public devotions in the church; for which purpofe they made we of certain known forms of words, to give notice when each part of the fervice began. Whence they are fometimes called eirokerukes; "the holy cryers of the church."

Beacons had, by licence and authority from the hifoo?, a power to preach, to reconcile penitemis and grant them abfolution, and to reprefent their bitheps in general councils. Their othecent of the church was to take eare of the neceffitons, fuch as orphans, widows, prifoners, and all the poor and hok who thad any tithe to be maintainco unt of the revenucs of the church; to inquire into the morals and converfation of the people, and to make their report thereof to the bithop. Whence, on account of the variety of bufinefs, it was ufual to have feveral deacons in the fame church.

In the Romifh chuach, it is the deacons office to incenle the uffirating pricil or prelate; to lay the corporal on the altar; to reccive the pattern or cup from the fubdeacon, and prefent them to the perfon officiating: to inconfe the chein; to receive the pax from the oficiating prelate, and carry it to the fubdeacon; and
at the pontifical mafs, when the bifhop gives the blef. Deacones. fing, to put the mitre on his head, and to take of the archbimop's pall and lay it on the altar. In Enrland, the form of ordaining deacons, declares that it is their office to affit the pricft in the diftribution of the holy communion: in which, agreeably to the practice of the ancient church, they are confined to the adminittering the wine to the communicants. A deacon in England is not capable of any ecclelialical promotion; yet he may be a chaplain to a family, curate to a beneficed elergynan, or lecturer to a parith-church. He may be ordained at 23 yeats of arge, anno currente; but it is exprefly provided, that the hithop thall not ordain the fame perfon a priett and deacon in the lame day. Deacons, according to St Paul, hould be chatle, fincere, and blamelefs; neither great drinkers, nor given to filthy lucre: they hould hold the inffery of the faith in a pure confcrence; and hould be well apptoved hefore they are admitted to the miniftry. in the church of Scotland, the deacon's uffice is only to take care of the poor.

DEACONESS, a female diacon; an order of women who had their diftinct offices and fervices in the primitive church. This office appears as ancient as the apoltulical age; for St Paul calls Phebe a fervant of the church of C'enchrea. Thee eriginal word is $f_{2} x_{0}$ xovs, anfwerable to the Latin word miniftra. Tertullian calls them ridue, widows, becauie they were commonly chofen out of the widows of the church; and, for the fame reafon, Epiphanius, and the coun-
 becanfe none but fuch were ordinarily taken into this office. For, indeed, by fome ancient laws, thefe four qualifications were required in every one that was to be adinitted into this order. I. That the fhould be a widow. 2. That the fhould be a widow that had born children. 3. A widow that was but once married. 4. One of a conliderable age, 40, 50 , or 60 years old. Though all thele rules admitted of exceptions. Concerning their ordination, whether it way always performed by impolition of hands, the learned are much divided in their fentiments. Baronius and Valefius think they were not, and make no other account of them than as mere lay-perfons. But the author of the conftitutions, fpeaking of their ordination, requires the bifhop to ule impofition of hands, with a form of prayer which is there recitel. We are not, however, to imagine, that this ordination gave them any power to execute any part of the facerdotal othice. They were only to perform fome inferior fervices of the church, and thofe chiefly relating to the women for whofe fakes they were ordained. One part of their office was to arfit the miniller at the baptizing of women, to undrets them for immertion, and to drels them again, that the whole ceremony might be performed with all the decency becoming fo facred an ation. Another part of their office was to be priyate catechifts to the womencatechumens who were prepaning for baptifm. Ther were likewife to attend the women that were feck and in diftrefs; to miniter to martyrs and confeffors in prifon; to attend the womens gate in the church; and, fatty, to aftign all women their places in the church, regulate their behaviour, and prefide over the rett of the widows; whence in fome canons they are fyld! Thoxaitinevat, "governefies." This order, which fince
easonry the toth or rith century has been wholly faid afide, was not abohffed every where at once, but continued in the Greek chureh longer than in the Latin, and in fome of the Latin churcles longer than in others.
I) EACONRY, Diaconate, the order or minitry of a deacon or deaconefs. See Deacon and Deaconess.
Deaconry, Dinconia, is alfo a name ftill referved to the chapls and oratories in Rome, under the direction of the feveral deacons, in their refpective refpective regions or quarters.

To the deacomies were annexed a fort of holpitals or boards for the diftribution of alms, governed by the regionarydeacons, called carclinal lecaions, of whom there were feven, anfwering to the feven regions, their chief being called the arthdeacon.

The hoiphal atejoining to the church of the deaconry had an adminitratur ior the temporal concerns, called the fither of the decionry, who was fumetimes a pricit and fometines a layman.
At perent there are are fourteen of thefe deaconries or hofpitals at Rome, which are referved to the cardinals. Du-Cange gives us their: names: as, the deacoury of St Maria in the Broad-way, the deaconry of St Euftachio near the Pautheon, \&ec.
DEAl) languges. Sice Philology, chap. iii. Prefervation of Dfas Bodis. See Embalang.

D) EAD-Lights, certain wooden ports which are made to faften into the cabin windows, to prevent the waves from gunning into the thip in a hight fea. As they are malle exadly to fit the windows, and are flrong enough to relift the waves, they are alwass fixed in on the approacti of a form, and the glats lights taken out, which mult otherwife be flatered to fiects by the furges, and fuffer great quantities of water to enter the weffel.
$D_{\text {EAD }}$ - Iens-Eyes, in the fea-language, a kinci of blocks with many holes in them, but no thecvers, whereby the throwds are faftencd to the chains: the crow-feet reeve alfo through thefe holes: and, in fome thips, the main-ltays are fet tight in them; but then they have only one hole, through which the lenyards are pafted feveral times. SeePlate Cl,XV.

Dame's Part. See Latv, No ckxai. 6.
$D_{\text {E }}$-R-Rerkoning, in navigation, the jadgment or eftimation which is made of the place where a thip is fituated; withont any obfervation of the havenly budies. It is difcovered by keeping an account of the difance the las ron by the log, and of her colurfe theered by the compaif; and by rectifying thefe data by the ufual allowances for drift, lee-way, iec. according to the fhip's known trim. This reckoning, however, is always to be corrected, as often as any good obfervation of the fun can be chataned.

De.id-Sea, in gengraphy, a lake of Indea, into which the river Jordan difcharg-s itfelf; being about 70 mites long and 20 bruad. See Asphaltites.
$D_{\text {FAD }}$-Topr, a difeafe incideur to young trees, and cured by cutting of the deal parts ciote to the next good twig or hoot, and claying them over as in grafting.

Dr.th-Water, at fen, the chdy-water juft aftem of a fhip; fo called, hecante it does not quads aw ay formft as the water running by her fides does. Whey tay that
a mip makes inuch dead-water when fhe has a great tddy folluwing litr Rerra.

Desmir Ficud, in Englifh taw buuks, a profeftion of irreconcilcable enmity, till a perfon is revenged by the death of his enemy. The worl feul is derived from the Geiman Fohsi; which, as Huttuman obferves, tignifies modo bellim, modo cupptales inimiciticas *. Such " Sce Feur. cumity and revenge was allowal by law in the time of the Saxons, viz. If any man was hilled, zad a pecuniary fatisfaction was not made to the kindred, it was lawhel for then to take up arms and revente themfelves on the murderer: which was called diadly find. And this probably was the uriginal of an Apptal.

IEAFNESS, the fate of a perfon whe wants the fenfe of hearing; or the difeafe of the ear, which prevents its due reception of founds. Sce MedicineIndex.

Deafnefs generally arifes either from an obitruction or a comprellion of the auditory nerve; or from fume collection of matter in the cavities of the inner ear ; or from the auditury pallage being ftopped up by fome hardened excrement; or, laftly, from fame excrefeence, a fwelling of the glands, or fome foreign body introduced within it.

Thofe born deaf are atio dumb, as not being able to learn any language, at leatt in the common way. However, as the eyes in fons meafure ferve them for ears, they may underfland what is faid by the motion of the lips, tongue, \&c. of the fpeaker; and everz accufon themfelves to move their own, as they fee uther people do, and by this means learn to fpeak.Thus it was that Dr Wallis taught two yourr gentlemen burn deaf to know what was faid to them, and to return pertinent anfwers. Digby gives us another inHance of the fame within his own knowledge ; and there was a Swifs phylician lately living at Anderdara, one Jotn Conrad Amman, who eficeted the fame in feverat children born deaf with furprining fucrefs. He las velued the thing to a fixed art or method, which hi: has publifhed in his Surchus Junqus, Amidulod. ICy: and de Luquîlu, ibid. 1700 .
In the Phit. Tianf. No 3ir. we have an account by Mr Waller, R. S. Secr. of a man and his fitter, each about 50 year: whe bona in the hame town with Mr Waller, who had neither of them the leall fenfe of hearing ; yet boul of them knew, by the motion of the lips only, whatever was faid to them, and would anfwer pertinnatly to the queition propoled. It feems they conid hoth hear and fipeak when children, but lof their fente afterwards; whenee they retained their fpeech, which, though uscouth, was yet intelligible.

Such another inllance is that of Mr Coduly's daughtex, miniller of St Gervais in Genera, related by Biflup Burnet. "At two years ohd they perceived the had luft her learing; and ever tince, thongh ble hearg great wises, yet hears nuthing of what is faid to ler. But by obferving the motions of the mouth and lips of whers, the acguired fo many words, that out of the fe the thas forned a burt of jargon, in which the can hold convelfation whole days with thofe that can fpeak her langrage. She kuovs nothing that is faid to her mo. lets the fee the motion of their mouths that fpeak to her, fo that in the night they are obliged to light candes so Ipeak to her. Ons thing will appear the thrangeit

Deal, ftrangeft part of the whole narration: fhe has a fifter, Dean.

- See further the article
13.anthers. with whom the has practifed her language more than with any body effe; and in the night, by laying her hand on her fifter's moutl, the can perceive by that what fhe faith, and fo can difeourfe with her in the dark." Burn. Let. IV. p. $248^{*}$.

It is obfervable, that deaf perfons, and feveral others thick of hearing, hear better and more eafily if a loud noife be raifed at the time when you fpeak to them : which is owing, no doubt, to the greater tenfion of the ear-drum on that occafion. Dr Wallis mentions a deaf woman, who if a drum were beat in the room could hear any thing very elearly; fo that her huband hired a drummer for a fervant, that by this means he might hold converfation with his wife. The fame author mentions another, who, living ncar a fteeple, could always hear very well if there was a ringing of three or four bells, but never elfe.

DEAL, a thin kind of fir-planks, of great wie in carpentry. They are formed by fawing the trunk of a tree inio a great many longitudinal divifions, of more or lefs thicknefs according to the purpofes they are intended to ferve.

A very grood method of feafoning planks of deal and fir is to throw them into falt water as foon as they are fawed; and keep them there three or four days, frequently turning thein. In this cafe they will be rendered much harder, by drying afterwards in the air and fun : but neither this, nor any other method yet known, will preferve them from Shrinking.

Rods of deal expand laterally, or crofs the grain, in moif weather, and contract again in dry ; and thence have been found to make an ufeful hygrometer.

Deal, a town of Kent in England, lying between Dover and Sandwich, in E Long. 1. 30. N. Lat. 51. 16. is fuppofed to be the Dola of Nennius, and is fi tuated on a flat and level coatt. This town, according to Dr Canppenl, juftifies an obfervation he had made in favour of fituations of this kind, viz. that they are lefs liable than others to be injured by the fea. The town of Deal, as far as we are able to judge, except it may be the fea's flrinking a little from it, is in much the fane condition in which it ever was, even from the earlieft accounts. The learncd Dr Halley has proved, AHifctllanea Curiofa, vol. iii. p. 426, that Julius Cxfar landed here, Augut 26 th, the year before the coming of Chrilt 55.-The great conpeniency of landing has been of infinite fervice to the place; fo that it is large and populous, divited into the upper and lower towis, adorned with many fair buildings, and is in effer the principal place on the Downs.

DEAN, an ecclefiaftical dignitary in cathedral and collegiatc chusches, and head of the chapter.

Kural DEAN, ealled alfo Alech-prefoyter, originally exercifed jurifdiction over ten churches in the country, and afterwards became only the bifiop"s fubflitute, to grant letters of admainiftration, probate of wills, \&c.; to convocate the clerge; and to ingnify to them fometimes by letters the bimop's will, and to give induction to the archdeacon. Their office is now lolt in that of the archdeacons and chancellors.
$D_{F A N}$ of a Moualery, wats a fuperior eftablinhed under the abbut, to eafe him in taking care of ten monks; whence he was ealled diarous.

DEAS ind Ctater, ase the council of the bifhop, to
affit him with their advice in affairs of religion, and alfo in the temporal coneerns of his fec. When the relt of the clergy were fettled in the feveral parifhes of each diocefe, thefe were referved for the celebration of divine fervice in the bifhop's own eathedral ; and the chief of them, who prefided over the reft, obtained the name of decanus or dean, being probably at firlt appointed to fuperintend ten canons or prebendaries.

All ancient deans are elected by the chapter by conge d'efire from the king, and letters miffive of recommendation, in the fame manner as bihops; but in thofe chapters that were founded by Henry V1II. out of the fpoils of the diffolved monatteries, the deanery is donative, and the inltallation merely by the king's letters patent. The chapter, confilting of canons or prebendaries, are fometumes appointed by the king, fometimes by the bifhop, and fometimes elected by each other.

The dean and chapter are the nominal electors of a bifhop. The bihop is their ordinary and immediate fuperior; and has, generally feaking, the power of vifiting them, and correcting their exceffes and enormities. They had alfo a check on the biflop at common law; for till the ftatute 32 Hen. VIII. e. 28. his grant or leafe would not have bound his fucceffors, unlefs confirmed by the dean and chapter.
$D_{\text {Ean }}$ of Guild. See Law, N clviii. ir.
DEANERY, the office of a DEAN.-Deaneries and prebends may become void, like a bihopric, by death, by deprivation, or by relignation either to the king or bihop. If a dean, prebendary, or other fpiritual perfon, be made a bilhop, all the preferments of which he was before poffeffed are void; and the king may prefent to them in right of his prerogative royal. But they are not void by the election, but only by the confecration.

DEATH, is generally confidered as the feparation of the foul from the body; in which fenfe it fands oppofed to life, which confifts in the union thereof.

Phyficians ufually define death by a total Itoppage of the circulation of the blood, and a ceffation of the animal and vital functions confequent thereon; as refpiration, fenfation, \&c.

An animal body, by the actions infeparable from life, undergues a continual change. Its finalleft fibres beeome rigid; its minute veffels grow into folid fibres no longer pervious to the fluids; its greater veffels grow hard and narrow; and every thing becomes contracted, clofed, and bound up: whence the drynefs, immobility, and extenuation, obferved in old age. By fuch means the offices of the minuter vefiels are deAtroyed; the humours ftagnate, harden, and at length coalefee with the folids. Thus are the fubtilift fluids in the body intercepted and loft, the concoction weakoned, and the reparation prevented; only the coafer juices continue to run flowly through the greater veficls, to the prefervation of life, after the animal functions are dellroyed. At length, in the procefs of thefe changes, death itiolf becomes inevitable, as the neceffary confequence of life. But it is rare that life is thus long protracted, or that death fucceeds mercly from the decays and impairment of old age. Difeafes, a long and horrid tain, cut the work thurt.

The figns of death are in many cafes very uncertain. If we confult what Windlow or Bruchier have faid on

Dean
Death
this fubject, we flall the convinced, that between life and death the flade is fo very undillinguifable, that even all the powers of art can fearcely determine where the one ends and the other begins. The colour of the vifage, the warmth of the body, and fupplenefs of the joints, are but uncertain figus of life itill fubfilting; white, on the contrary, the palenefs of the complexion, the eoldnefs of the body, the ttiffinefs of the extremities, the ceflation of all motion, and the total infenfibility of the parts, arc but uncutain marks of deâth begun. In the fane manner alf, with regard to the pulfe and breathing; the it unotions are ofen fo kept under, that it is impoffible to perceive them. Wy bringing a looking-glats near to the mouth of the perfon fuppoicd to be dead, people often expect to hind whether he breathes or not. But this is a very uncertain experiment: the ghfs is frequenly fultied by the vapaur of the dead man's hody ; and wften the perfon is atill alive, though the glafs is no way tamithed. In the fame manner, neither buraing nor farifyng, neither noifes in the ears nor pungent ipirits applid to the noitrila, give eertain figns of the difeontinance of life; and there are many inflances of ferfons who have endured them all, and afterwards recovered without any external affitance, to the attonithment of the feestators. This ought to be a caution ayaind haty buticuls, cipecially in eafes of fudden death, drouning, \&c,
$D_{\text {EATA }}$ in Lazw. In law, there is a natural death and a eivil death: natural, where nature itfelf expires; civil, where a perfon is not actually dead, but adjudged fo by law. Thus, if any perfon, for whofe life an eftate is granted, remains beyond fea, or is otherwife abfent, feven years, and no proof made of his being alive, he thall be accounted naturally dead.

Brober's of $D_{\text {eut }}$, a denomination ufually given to the religious of the order of St Paul, the firtl hermit. They are called broikers of tieath, fratres a morte, on account of the figure of a death's litad, which they were always to have with them, in order to keep perpetually before them the thonghts of death. This order, by its conflitutions made in 1620 , does rot feem to have been eftablifhed long before Pope Paul V. Louis XIII. in 162 I , permitted them to fettle in France. The order was piob,bly fupprefld by Pope Urban VIII.

Jare of Dratubed. Sle Law, No cixaxi. 38--4.
$D_{\text {iafu }}$. Watch, in matual hiftory, a little infect famous for a ticking noife, like the beat of a watch, which the vulgar have long taken for a prefare of death in the family where it is heard: whence it is alfo called pedicalus, jatiditias nicrijages, puljatorius, \&c.

Thicre are two kinds of acath-watches. Of the firt we have a gond account in the Phil. Tranf, by Mir Allen. It is a fmall bettle, $5^{5}$ of aninch long, of a taikbrown coluur, fpotted; having phliucil wings under the vagina, a large eap or helmet on the head, and two antenne proceeding from beneath the eyes. and doing the office of probofeides. The part it beats withal, he ohferved, was the extreme edge of the fuce, which he choofes to call the upper-lip, the mouth being protracted by this bony part, and lying underucatio out of view.

This aceount is confirmet by Dr Derlam; wita this difference. that inftead of tiching with the upper-lip, he obferved the infect to ciraw back its mont:, and beat with its forelead. That author laide two death-
watches, a male and a female, which he kept alive in a box feveral montls; and could bring one of them to beat whenever he pleafed, by imitating its beating. By this tieking noife he could frequently invite the male to get up upon the other in the way of coition. When the male found he got $u_{p}$ in vain, he would get off again, beat very tageriy, and then up again: Whence the ingenious author concludes thrife pulfations to be the way whereby thefe infects woo one another, and fond out and invite each other to copulation.

The fecond kind of death-watch is an infect in appearatiec quitc different fion the frrt. The former coly beats feven or eight flrckes at a time, and quicker; the latter will beat fome hons ingether withous internifion; and his ftrokes are more ieifurely, and like the beat of a watch. This latter is a fmall greyim infect, much like a loufe when siewed with the naked cye.
It is very common in all parts of the houfe in the fummer-months: it is very nimble in running to for ter, and hy ef beating whea difturbed; but will beat very freely before you, and alfo anfwer the beating, if you can view it without giving it difturbance, or flaking the place where it lies, \&e. The author eannot fay whether they beat in any other thing, but he never heard their nuife except in or near paper. As to their noife, the fame perfon is in doubt whicther it be made by their heads, or rather fnouts, againil the paper; or whether it be not made after fume fuch manner as. grafhoppers and crickets make their noife. He ino elines to the former opinion. The reafon of his doubt is, that he obferved the animal's body to fhake and give a jerk at every beat, but could fcarce perecive any part of its body to touch the paper. But its body is fo fmall and near the paper, and its motion in ticking fo ouick, that he thinks it might be, yet he not perctive it. The ticking, as in the other, he judges to be a wocing act; as having obfurved another, after much beating, come and make offers to the heating infect, who, after fome offers, left off beating, and got upon the beck of the other. When they were joined, he left off again; and they continued fonce hours joined tail to tail, like dog and bitch in coition. Whether this infect changes its thaje and becomes another animal or not, be wannet fay; though lie has fome caufe to fufpeet that it becomes a fort of fly. It is at fritt a minute white efrg, much fradikr than the nits of lice; though the infeet is near as big as a loufe. In March it is hateled, and creeps about with its thell on. When it firft leaves its fhell, it is even fimaller than its egg; though that be fearee difcernible without a microfcope. In this flate it is perfectly like the mites in cheefe. From the mite-itate they grow gradually to their mature perfect fiate. When they ieeome like the old ones, they are at firft very fmall, but rua abuat much more fwiftly than befure.
DF EXNTURE, a term of trade ufed at the cuftom. houfe for a kind of eertificate figned thy the offieers of the cuifoms, which intiths a merchant exporting goode to the receipt of a bounty or draw-back. All merchandifes that are defigned to be taken on board for that royage being enterd and fripped, and the fhip being regularly cleared out, and failed out of port ou lier intended voyage, debentures may be made out from the exporter's entries, in order to obtain the drawbacks, allowances, bcuntice, or preniums; whicia
ditbenture?

Death, Deben"ute.

## I) E C [6g ] D E C

S. leatme debentures for foreiga goodsare to the paid within one month after denand. And in makine out the le debentures, it mull be oblerved, that cuery picee of vellum, parchment, or paper, containing any debenture for drawing back cufloms or duties, mith, before wit ting, be famped, and pay a duty of Bll.

The forms of debentures vary according to the merchandife exported. In the execution of debenterces for tobacco, it mut be priculaty oberved. 1. 'That debentucs for the fane quantity may be made on one or more parchonents. 2 'That the expomen's oath mu! be printed, fuecifyirg whether he acts for limfelf or on commifion. 3 lif exported to any other foreien ports than Ireland, the word Irdind mult be added to the oath after Great Brit tin. A. That as no tolaceco may be confumed on board of thips of war in Europe but what has paid full duties, and been mamufactured in Great Britain, no drawback is to be allowed for tobacen exported in any man of war. 5. That the tight pounds fer hogthead of 350 puonds, on more, allowed for dranght at importation, muft not be dedncted on eaportation. 6. That debentures for tobaces exported to lreland mult not be paid till a certifieate be produced, telifying the landing thereof. 7. That no perfons may fwear to the exportation but fuch as are permitted to firear to debentures for other grods. In debentures for all other foreign goods, no perfon may Le armitted to fwear to the exportation hat the true exporter, either as a proprietor, or who, being employed by commifion, is concemed in the dirtetion of the voyage. All kinds of debentures, before chetivered or paid to the exportes, are entered into a Ceparate book Eept for that purpofe by the cullector and comptroller of the cultoms

## debita fundi. See Law, No chavi. 1.

Debita Frugum. See Law, $\mathrm{N}^{2}$ clax. ${ }^{17}$.
1)EBLLITY, among phyficians, a relaxation of the folids, occafioning oftentimes weakneffes and faiutings.
DEBIR (anc. geng.), a facerdotal city of Palentine, near Hebron; but neither diftance, nor poim of the compals on which it lies, can be determined. It was anciently called Kariath-fopher or Kirjath-fepher, and Kïjath-fanna (Jothua).-Another Ditir in the tribe of Gad, heyond Jomdan.
DEBRECHEN, a town of Upper Husgary, about 77 miles caft of Buda. E. Long. 21. 10. N. Lat. 47. 45.

DEBRUIZED, in heraldry, a term peculiar to the Englifh, hy which is intinated the grierous rellaint of any animal, debarred of its natural lieedom, by any of the ordinaries being laid over it.
DEBT, in law, any thing due to another, whether it be money, goods, or fervices; or the adition brought for recovering the fame.

National Dest. Sue 「unds and Nationda Deht.
DEBTOR, a perfon who owes ally thing to another; in contradifination to creditor, which is he to whom the debt is owing.

Debtor, in merchants accounts. See Bookkebping.

DECAGON, in geometry, a plane figure with ten fides and ten angles.

DECADE, a word ufed by fome old writers for the number ten, and decades for an cnumeration by
$\mathrm{N}^{\circ} \mathrm{g} 8$.
tens. The word is formed from the Latin decas, which Decagn is deaved from a Greek word of the fame import. The word has been more peculiarly appropriated to the ammer of books, q. d. decades, into which the Roman Hillory of Thiss Livius is divided. Hence alfo came duradi arithmetic, the Decameron of Boccacio, ac.

DECACMNIA (from dive tin, and yuv, a cuman), the name of an urder, or fecondary divifion, in the clatis decand:ia, of the fexual method, confiting of plants whole flowers are furnified with ten Atamina and the fame number of ftyles; which latt are confidered by Linnxus and the fexualifs as the female orrans of generation in plants. Neurada and American nighthade fumith examples.

DECAL OGUE, the ten precepis or commandments delivered by God to Mofes, alter engraving them on two tables of thone.

The Jews, by way of excellence, call theie commandments the ten arords, from whence they had afterwards the name of derolgue: but it is to be obferved, that they joined the firtl and fecond into one, and divided the lat into two. They undertiend that againt teating to relate to the tetealing of men, or kiduapping; alleging, that the Acaling we another's goods or property is fortuden in the lati commandment.
the emperor Julian oljeeted to the decalogne, that the precepts it contained (thode only excepten) which concern thic worlip of falte gods, and the obfervation of the fabbath) were already fo familiar to all wations, and to miverdally recived, that the were unworthy, for that wery reafon, to be delivered, by fogereat a ke. gillator, to to pecul:ar a people. 'The church of Rome has truck the fecond commandment quite out of the decalogue; and to make their number complete, hath folit the tenth into two: The reaton of which may be eatile conceived.

DECAN, a kingdom of Afa, in the peninfula on this fide the Canges, bounded on the fouth by the kingdom of Bifneqar, on the well by the ocean, on the nosth by Mogulitan, and on the ealt by the momntains which feparate it from Golconda.
J)ECANB)RlA (bax tan, and ave a bofond), I.inmens tenth clats, comprehending thofe hermaphodite plants which bear flowers wh ten famina. Se Bumany, p. 430.
1)ECANTATIUN, among chemits, \&c. the gently pouring off a liquor from it feces, by inclining the lip or canthens of the velfet; whence the name.

J ECANUS, in Roman antiquity, an oficer who prefided over the other ten offecer, and was head of the contubernium, or derjeant of a bie of loloiers.

1) ECAPOLLS (anc geog.), a dithét beyond Jordan, almott all of it belonging to the halitribe of Mamafle; before the captivity, called Palyïn; but after occupied by heathen, who could root he driven out. It comprifed, as the name denotrs, ten paincipal cities on the vilherdede the jordan, if we cxeceptiog thophis, which Itood on this fide, but its territom w the other.
I)ECAPROTl, decemprami, in Roman antiquity, officers for gathering the tributes and taxes.

The decaproti were alfo obliged to pay for the dead, or to anfwer to the emperor for the quota pats of fuch as died out of their own eflates.

DECASPERMUM, in butany: a genus of the monogynia urder, belungitg to the icufandria clafs of 5

recafyle plants. The caly $x$ is a turbinated perianthium, quinquefid at the apex. The corold has tive roundin petals. The Itamina are many flitomn filaments, a little forter than the corolla. The pericarpium is a dry, ghobular, decemlocular berry, with folitary eggflaped feeds.
DECASTYLE, in the ancient architeEture, a building with an ordiance of tcin columns in front, as the temple of Jupiter Olympius was.

DECE iT, in lave, a fubtle trick or device, to which may be added all manner of craft ard collution, or underhand prattice, ufed to defraud another, by any means whatever.

DECFMDER, the laft month of the year, wherein the fun enters the trof ic of Capricom, arsimakes the winter follitice.

In Romulus's year. December was the tenth month, whence the name, viz. from diciem "ten:" for the Rumans began their year in March.

The month of December was under the protection of Vefta. Romulus amigned it 30 days, Numa reduced it to 29, which Julius Cafar increafed to 3 1.

Under the reign of Commodns, this month was called, by way of flattery, Alwazonius, in honour of a courtefan whom that prince pafionately loved, and had got painted like an Amazon; but it only kept the name during that emperor's life.

At the latter end of this month they had the juveniles ludi; and the country people kept the featt of the goddefs Vacuna in the fields, having then gathered in their fruits and fown their corn ; whence feems to be derived our popular fettival called barveff.bome.

DECEM PAGI (anc. geog.), a town of Belgica: Now Dienfe, in Lorrain, on the rivulet Scille or Selna, near the lake Lindre, about feven German miles to the north-eaft of Nancy.

DECEMPEDA, $\triangle$ :xarous, tun-fut rod, an inflrument ufed by the ancients in meafuring.

The decempeda was a rule or rod divided into ten feet; wheuce its name, from decem "ten," and pes, pedis, "foot." The foot was fubdivided into twelve inches, and each inch into ten digits. The decempeda was ufed buth in meafuring of land, like the chain among us; and by architects to give the proper dimenfions and propurtions to the parts of their buildings, which ufe it ftill retains. Horace, lib. ii. od. is. blaming the magnificence and delieacy of the buillings of his time, obferves, that it was otherwife in the times of Romulus and Cato; that in the houfes of private perfons there were not then known any porticoes meafured out with the decempeda, nor turned to the north to take the cool air.
DECEMVIR1, ten magitrates of abfolute anthority among the Romaus. The privileges of the patricians raifed diffatisfaction among the plebeians; who, though freed from the power of the Tarquins, till faw that the adminiftration of juftice depended upon the will and caprice of their fuperiors, without any written flatute to direct them, and convince them that they were governed with equity and inpartiality. The tribunes complained to the fenate, and demanded that a code of laws might be framed for the ufe and benefit of the Roman people. This petition was complied with; and three ambaffadors were fent to Athens and all the other Grecian ftates, to collect the laws of So-

Vol. V. Part II.
lon and of aif the other celcbrated legiflaters of Greecc. Deicmeiri Upon the return of the commilioners it was univerfally agreed, that ten new magiltrates called Decemviri, fhould be elected from the icnate to put the project into exceution. Their power was ablolute, all other offices ceafed after their election, and they prefided owe the city with regal authority". I'hey were invert. ed with the badges of the contil, in the enjeyment of which they ruceeded by tums; and only one was preceded by the fafces, and had the power of affernbling the fenate and contirming decrees. The tirit de. cemins were Appius Claudius, 'I'. Genutius, P. Sextus, Sp. Veturius, C. Julius, A. Manlius, Ser. Sulpitius, Pluriatius, T. Romulus, Sp. Poflhumius, in the year of Rome 302. Under them the laws which had been expofed tu public view, that every citizen might fpeak his fentiments, wore publicly approved of as conIfit ctional, and ratified by the prielts and angurs in the molk fokmn and religions manner. They were ten in nuarber, and were engraved on tables of brafs; two were afterwards added, and they were called the laws of the twelve tables, leges duoderim tubularzm, and leges decemzira. lis. The decemsiral power, which was behcld by all ranks of pcople with the greatell fatisfaction, was continued; but in the third year after their creation the deeemvirs becane odious on account of their tyranny, and the attempt of Ap. Claudins to ravifh Virginia totally abolithed the office. The pcople were fo exalperated againt them, that they demanded them from the fenate to burn them alive. Confuls were again appointed , and tranquillity 1 e -eftablithed in the ftate.- There were other officers in Rome called decemvirs, who were originally appointed in the abfence of the protor to adminiter juftice. Their appointment became afierwards necefary, and they generally affiled at fales called jubioglationes, becaufe a Spuar, hafla, was fixed at the door of the place where the goods were expofed to'fale. They were called decemviri litibus judicandis. The officers whom Tarquin appointed to guard the Sibylline books wore allo called decemeiri. They were uriginally two in number, called duamviri, till the year of Rome 388 , when the number was in. ereafed to ten, five of which were chofen from the plebeians and five from the patricians. Sylla increafed their number to fifteen, called quindecemvirs.

DECENNALIA, ancient Roman feftivals, celebrated by the emperors every tenth year of their reign, with facrifices, games, and largeffes for the people. The emperor Auguftus firft inftituted thefe folemnities, in which he was imitated by his fueceniurs. At the fame time the people offered up vows for the emperor, and for the perpetuity of the empise; which were therefore called zoota decomalia. Augultus's view in eltablifhing the decenalia was to preferve the empire and the fovereign power without offence or vellaint to the people. For during the celebration of this feath, that prince ufed to furrender up all his authority into the hands of the people; who, lilled with joy, and charmed with the goodnels of Augultus, immediately delivered it him back again.
DECHALES (Claudius Francis Millict), an excellent mathematician, mechanic, and altronomer, defeended from a noble family, and born at Chamberry in 161 x . His principal performances are an edition of Euclid's elements of geometry, in which the unfervice-

Dechuies.

## D E C <br> [ 698 1 <br> D E C

Dxiacts able profontions are rejected, and the ufes of thofe reDecius tained, annexed ; a dicourfe on forification; and another on navigation. Thefe with others have been col-
lecied firf in 3 vols folin, and afterwards in 4, under the title of Mirumbs Mathematicus: being indeed a complete coulfe of mathematics. He ditd in 1678, profefor of mathematics in the univerfity of Turin.

DECIATES, or Deciati, (anc. geng.) a people of Gallia Narbutentis. next the borders of Italy, on the Mediterranean. Now the diocefe of Grace and Antibes. Deciatum oppizium, was a sown lituated between Antibes and Nice.

DECIDUOUS, an appellation chiehy ufed in zefpect of plants: thus, the ca!yx or cup of a fower is faid to be ciciduons, when is fallo along with the flowerpetals; and, on the contrary, it is called permanent, when it remains after they are fallen. Again, deciduous leaves are thofe which fall in autumn ; in contradiftinction to thofe of the ever-greens, which semain all the winter. Sce Defoliation.

DECIL, in altronomy, an afpect or pofition of two planets, when they are diftant from each uther a tenth part of the zodiac.

DECIMAL arithmetic, the art of computing by decimal fractions. See Arithmetic.

DECIMATION, a punifhment inaicted by the Romans, on fuch foldiers as quitted their pofts, or behaved themfelves cowardly in the field. The names of the guilty were put into an urn or helmet, and as many were drawn out as made the tenth part of the whole number, and thofe were put to the fword, and the others faved. This was called decimare; a word of the ancient Roman militia, who, to punim whole legions when they had failed in their ducy, made every tenth foldier draw lots, and put him to death for an example to the others.

As the Romans had their decimatio, they had alfo the vicefinatio, and even centcfinatio, when only the 20 h or 100 th man fuffered by lot.

DECIPHERING, the art of finding the alphabet of a cipher. For the ant both of Ciphering and Decipbering, fee the article Cipher.

DECILS Mus, a celebrated Roman conful, who, after many glorious expluits, devoted himfelf to the geds manes for the fafety of his country in a batule againt the Latirs, about 340 years before the Auguftan age. His fon Decius imitated his example, and devoted himfelf in like manner in his fourth confulfhip, when fighting againf the Gauls and Samnites. His grandfen alio did the fame in the war againt Pyrrhus and the Tarentines. This attion of devoting onefelf was of infinite fervice to the flate. The foldiers were animated by the example, and induced to follow with intrepidity a conmander who, arrayed in an unufual drefs, and addreffing himfelf to the gods with folemn invocation, rufhed into the thickelt part of the enemy to meet his fate.

Decius (Cn. Mlecius, Q. Trajanus), a native of Pannonia, fent by the emperor Philip to appeafe a fedition in Muefia. Intead of obeying his mafter's command, he affumed the impcrial purple, and foon after marched againt him, and at his death became the only emperor. He fignalized himfelf againft the Perfians; and when he marched againlt the Goihs, he pufhed sis horfe into a deep mark, from which be could not
extricate limfelf, and the perifed with all his army by the darts of the barbarians, A. D. $2 ; 1$, after a reign of two years,

DECK of a SEIP, (from decken, Dan. to cover); the planked foors of a thip, which connét the fudes tugether, and ferve as diferent platiorms to fupport the artillery and lodge the $m \in n$, as alfo to preferve the cargo from the fea in meschat velfels. As all Mips are broader at the lower deck than on the next above it, and as the camon thereot are always heavief, it is necelfary that the frame of it thould be much ftronger than that of the others; and for the fame reafon the fecond or middle deck ought to be Aronger than the upper deck or forecattle.
Ships of the fint and fecond rates are furnifhed with three whole decks, reaching from the ferm to the ftern, belides a forecalle and a quarter-deck, which extends from the fern to the mimmatt ; betwen which and the forccattle a vacancy is left in the midelle, opening to the upper deck, and forming what is called the suaif. There is yet another deck above the hinder or aftmof part of the quarter.deck, called the poop, which alfo ferves as a rouf for the captain's cabin or couch.

The inferior flips of the line of battle are equipped. wich two decks and a half; and frigates, floops, \&c. with one gun-deck and a half, with a fpar-deck below to lodge the crew.

The deeks are formed and furtained by the beams, the clamps, the water-ways, the carlings, the ledges, the knees, and two rows of fmall pillars called fanchions, \&ec. See thofe atticles.

That the figure of a deck, together with its correfponding parts, may be more clearly undertond, we have exhibited a plan of the lower-deck of a 74 gun fhip in Plate CLVI. And as both fides of the deck are exaetly fimilar, the pieces by which it is fupported appear on one fide, and on the other fide the planks of the floor of which it is compofed, as laid up on thofe upper pieces.
A, the principal or main hatch-way.
B, the Itern-pol.
C, the Eem.
D , the beans, compofed of thrce pieces, as exhibited by D , in one of which the dotted lines flow the arrangement of one of the beams under the other fide of the deck.
E, part of the vertical or hanging knees.
$F$, the horizontal or lodging knees, which faften the beams to the fides.

G, the carlings ranging fore and aft, from one beam to another.

H, the gun-ports.
I, the pump-dales, being large wooden tubes, which return the water from the pumps into the fea.

K , the fpurs of the beams, being curved pieces of timber ferving as half-beams to fupport the decks, where a whole beam cannot be placed on account of the hatchways.

L, the wing-tranfem, which is bolted by the middle to the Iten-polt, and whofe ends reit upon the faffionpieceâ.

M, the bulk.head or partition, which inclofes the manyer, and prevents the water which enters at the bawte-holes fiom rubsing aft between decks.

N,

NN, the fore batch-wryy.
OO, the after latch-way.
$P$, the drum-head of the gear capllern,
Pp, the drum-head of the main capitern.
Q. The wing-tranfom knee.

R , one of the breall-hooks under the gun deck.
S, the breaft-hook of the gun-deck.
T" $\Gamma$, the ftation of the chain-pmops.
V , the breadth and thicknefs of the timbere at the heighe of the gun-deck.

UU, feutles leading to the gunner's flore-room, and the bread-room.

W , the fation of the fore-mat.
$X$, the flation of the main-maf.
$X$, the flation of the mizen-mat.
Z, the ring-bolts of the decks, ufed to retain the cannon whilf charging.
a a, The ring-lvits of the filea wherenn the tackles are hooked that fecme the canoon at fea.
caad, The water-ways, through which the feupper holes are pierced, to carry the water off from the deck into the fea.
h b, Plan of the Soremof and aftmoft cable-bits, with their crof-piccesers, and their !andads e e.

Thus we have reprefented on one fide all the pieces which fuftain the deck with its cannon; and on the other lide, the deck itfelf, with a tier of 32 pomders planted in battery therenn. In order alfo to fhow the ufe of the brecching and train-tackle, one of the guns is drawn in as ready for charging.

The number of beams by which the decks of hips are fupported, is often eery different, according to the practice of different countries; the frength of the timber of which the beams are franed; and the fervices for which the fhip is calculated.

As the deek which contains the train of a fire-fhip is furnulhed with an equipage peculiar to itfelf, the whole apparatus is particularly defcribed in the article Fine-Ship.
$F_{\text {lifl }}$ b-D $D_{E C K}$ implies a continued floor laid from flem to ltern, upon one line, without any flops or in. tervals.

Half- $D_{z i x}$, a fpace under the quarter deck of a flip of war, contained between the foremoft bulk-head of the fteerage and the fore-part of the quarter-deek. In the colliers of Northomberland the fleerare itfelf is called the balf-leck, and is ufually the babitation of the crew.

DECLAMATION, a fpeech made in pullic, in the tone and manner of an oration, uniting the expreffion of ation to the propriezy of pronurciation, in order to give the fentiment its full impreffion upon the mind. According to the manners and cultoms of the prefent age, public harangues are made only, in the pulpit. 2. In the lenate, in coancil, or other pablic aftembly. 4. By public profeflurs. 5. On the theatre.

1. With regard to the declamation of the pulpit, the dignity and fanctity of the place, and the importance of the fubjek, require the preacher to exert the utmoft powers of his woice to produce a pronunciation that is perfectly diftinet and harmonicms, and that he obferve a deportment and action which is expreffive and graceful. No man, therefore, who is deflitute of a voice, thould arcend the pulpit, and there act the pait of a
pantomime before his audience. The preacher fromb Dechantonot, however, roar like a common erger, and end the car with the roice of chunder; for fuch kind of decti. mation is not only withont meaning and withot per. perfids fuafon, but highly ineoremou; with the meck and Elemats. geatle expreffions of the erufpol. He Rould likewile take particnlar care to avnich a monotony; his voice Thonld rife from the beginning, as it were by degrecô, and its greateft trength thonld te exerted in the application. Ezoln infersion of the voice floobld be adapted to the phrale, and to the meaning of the words; aud each remarkable expreffion foould have its pecmiar inflexion. 'the dogmatic requires a plain, umiform tone of vinice only; and the menaces of the goffel demand 2 greater force than do its promifes and rewards: but the latter hould not be pronounced in the fuft tone of a flute, yor the former with the loud found of a trum. pet. 'T'he voice thould till retain its natural tone in a!! its varions inflexions. Llappy is that preacher, to whons nature bas given a voice chat is at once frong, flesible, and harmonious.

An air of complacency and benevolence, as well as derotion, thould be conftancly vilible in the countemance of the preacher. But every appearance of affectation mutt he carefully avoided: for nothing is fo difgultful in an audience, as even the femblance of diffimulation. Eyes conftantly rolling, tuncd towards heaven, and Hreaming with tears, rather denote a bypocrite, than a man poffefed of the real fpirit of religion, and that feels the tue import of what he preaches. An air of affected devotion i fallibly deftroys the efficacy of all that the preacher can ray, however jult and inportant it may be. On the other hand, he mult avoid every appearance of mirtl or raillery, or of that cold unfeeling manner which is fo apt to freeze the hearts of bis hearers.

The body fhould be in general ereet, and in a natural and eafy attitudc. 'The perpetual movement, or contortion, of the body, has a ridiculons effect in the puipit, and makes the figure of a preacher and a harlequin much too fimilar. But, on the other hand, he ought not to remain conftantly upright and motion. lefs, like a fpeaking llatue.

The motions of the hands give a ftrong expreffion to a difcourfe; but they fhould be conftantly decent, grave, noble, and expeffive. The preacher, who is inceffantly in action, who is perpetually clafping his hands, or who menaces with a clenched filt, or counts his arg!nments on his fingers, will only excite mirth among his anditory. In a word, declamation is an art that the
 'The delign of a fermon is to convince, to affect, and to perfurde. The voica, the countenance, and the action, which are to produce this triple effect, are therefore the oljeeds th which the preacher fhould particulaty apply himfelf.

I1. The declamation of a minifer or fitefman in the fenate, in council, or other publicaftembly, is of a more unconfined nature. To perfuade, to move the paftions, and gain an afcendancy in a. public affenhlys the orator thould himfelf feel the force of what he fays, and the declamation thould only exprefs that intermal fenfation. But nothing fhould be carried to excefs. A fuavity in the tone of voice, a dignity of deportment, a graceful action, and a certain tranquillity of counte${ }_{4}$ T 2
pauctis

Decham- nance, thould conflantly accompany the fatefmon when tion. he fpeaks in public, even when the is molt earnefly en.
gased in detate, or when he is addreffing lis. fovereign in perfon. A pleafing tone of voice, and a dillinet pronuaciation, prejudice the hearss greatly in the fpeaker's favout. A young man may improve thefe to a furprifing degree. Demollhenes, who had a natual impediment in his fpecech, was accuftomed to go to the fea-fonere, and partly filling his mouth with pebbles he declaimed with a lond voice. The ltones by degrees gave a volubility to his tonguc, and the roaring of the waves reconciled him infenfibly to the noife of the multitute.
III. The principal object of a public profefior is the inftruction of the ftudious youth: for which purpofe, he is to convince and perfuade. Every tone of voice, cvery expreffion of the countenance, or action of the body, which can produce this effect by enforcing the words, fhould therefore be employed by thofe who are to teach the fciences. 'There' is, moreover, one very eflential reflection which every profeflor ought to make, and which is, that the ehair, from which he harangues, is furrounded by young ftudents, naturally poffeffed with vivacity, not unfrequently ludierous, and for the moft part previoufly inflructed in the preparatory feiences. They are therefore conflanty inclined to criticife, to jeft, and to sidicule: for which reafon, the profeffor mould endeavour to infpire them with refpect and attention, by a grave, eommanding, and venerable countenance; and carefully avoid all appearance of grimace in his action, and every kind of affectation in his difeourfe, that he may not afford the leat opportunity for fleafantry.
IV. We are now come to thatrie dechamation. 1. This was very different among the ancients from what it is, and ought to be, with us, from the nature of the thing itfelf, and from the difference of eircumBances. Numberlefs paffages in Quintilian, and other ancient hiftorians, critics, grammarians, and commentators, evidently prove, that the ancient dramatic declamation was fubfervient to the rules of the mulical ${ }^{2}$ Ihythmus'; and by this, according to Arifides*, their action, as well as recital, was regulated. But to explain this feeming paradox, it will be neceflary to make here fome preliminary remarks. The ancients gave a meneh more extentive lignification than we do to the word mafic (myfica), which they derived from the mufes, or at leath from fome of them. It is for this reafon, that the Came Ainlides and Quintilian define it to be "An art that teacles all that relates to the we of the voice, and the manner of performing all the motions of the body with grace :" sirs decoris in vacisus motibus. Therefcre poetry, declamation, dancing, pantomimes, and many other geltures and exacifes, were fubfervient to this art.
2. That jart of general mufie which taught the art of declamation and gefture according to the rules of an eftablifhed method (and which we perform by inftinct, or at moft by the aid of common fenfe), was difinguifned by the name of bypocricic mufc: and this munical art was called by the Greeks oribfis ; and by the Romans faltatio. It was, however, fo far from being an advantage to the ancients to have had this att, which we have not, that it was, on the contrary, a mark of great imperfection. For, in the firn glace, it was an
inflance of ligh abfurdity to reprefent a tragedy, or Declam corredy, hefure an audience of twenty thoufand pople, the far greatcit part of whom could neither hear nor fie what pafied to any good purpofe, unlefs they were wuffefed of organs which we have not. The theatres of London and Paris may conveniently contain about a thoufand perfons; and that is found fufficiont in the molt populou: enties, where there are feveral places of entertamment on the fame day, and where the peopte are reafonable enough to fuceeed each other in their diverfions. As the features of the face could not be diftinguithed at fo great a dittance, and ftill lefs the alteration of countenance in order to reprefent the different patrons, they were obliged to have recourfe to maks; a wretehed, childifh invention, that deftroyed all the ftrength and variety of exprefion. Their action became extravagant; and, at the fanc time, fubfervient to a segular mechanifm, which prevented all the refinement, and all the pleafure of furprife, in the performance; and muit have had an effect horribly difagrecable to thofe who were placed near the ftage.
3. The egregious imperfection of their language likewife, which confilted of fyllables long and thort, whofe duration was determined by a fet meafure of time, and their manner of tuning thefe fyllahles, after the method of the orchefis of the Greeke, was another difadvantage. For by this means they determined by notes or chara气ers placed after the long and fhort fyl. lables, not only the nature, but the duration, of each action. Now, nothing could be more affected, more conttrained and difgutful, than fuch method of declaiming. How far fuperior in this refpect are the moderns, who confult nature alone in their theatric declamation; who can make the audience hear each figh; who can aecompany it with a proper attitude; who can inceflantly vary their action; who can feize the lucky moment, and make the countenance fully exprefs the fenfations of the mind? Nature does all here; and art, intinitely inferior to wature, did all among the ancients. Modern declamation cannot be fubfervient to a mufical rhythmus, feeing we fpeak rapidy, and without affectation. Our akeors learn their art without art, from nature itfelf, affifted by reflection; and they arrive at a degree of excellence infinitcly greater than that of the ancients, by a method far more imple, and by effrts incomparady more eafy.
4. We do not, moreover, precifely know what the theatric declamation of the ancients was; nor what were the mufical inftruments which accompanied that declamation. 'The title to the Eunuch of Terence fays, for example, "That Flaccus, the freedman of Claudius, made the mulic of that piece, in which be employed the two flutes, the right and the left." Thefe flutes, it is likely, gave the tone to the actor; which muf have had a very odd effect on the audience. Moft of the ancient pieces have fimilar titles. They who would be particularly informed of the art of declaiming among the Greeks and Romans, may read to advantage the Critical Rellections on Poetry and Painting by the Abbé du loos. The third part of that work confits entirely of learned refearches and ingenious reflections on this filly practice of the ancients. But as this art has bappily no place in modern declamation, and car at beft ferve only to make a parade

lunge fall him in thofe parts whore the whemence of Declarato. pafinn requices the itronget cforts. If we may be allowed the exprefion, the trongetl rouches, the boldell dixares, will nut there lland vut irum the pićture in $\underbrace{\text { Dcection. }}$

Do 11 a Kriking manar.
y. 'The deportencut of an ator thenkl be contanty gracefled, decint, and proper to the character be reprefents. An uld nam has a different poftion of body from a young petit maitic; an aged queen from a younf princefs; a moble $\$$ dlant from a valet de chambre. A rational oblivance of nature, and an imitation of the beit actors, are here the fureft glides. 'The fane may befad of the action of the hands, the theathic ftep, de. An inamimated figure, a body in the polition of a fatue, and hamls immoscable, are as difplating in the fecue as a player whole inceflant geflicuhation acfombles the action of a puppet.

IU. Euery actor who afpires to make his art fomething more than merely mochanical, will begin by emathing himfelf readily to repeat his part, that the defuct of his memory may not embarrafs his action. When he is fofar a matter of it, he will make it the finbject of lerions reflection in his clufet; endeavour to feize the true fenfe of the author; and to find out that. expreflisn of each fentiment and paffion, which is the moft namal, the mot itriking, and betl adapted to the Aage; and which he will cultivate by repeated enfys, till be is able to render it in its full force.

DECLARATORYaction. Sce Law, Noclexxii. 21.

DECLENSION, in grammar, an inflection of nouns according to their divers cales; as nominative, gonitive, dative, \&c. Sue Grammar.

DECLINATION, in aitronomy, the ditance of any ededtial object from the equinoctial, either northward or fouthward. It is either true or apparent, according as the real or apparent pace of the ubject is confidered. See Astronomy, n $4-9,410$.

Declination of the Sa-Cumpafs or Necdie, is its variation from the true meridian of any place.

Deizingtion of a Wrall or Plane, for Dials, is an arch of the horizun, contained either between the plane and the prime veatical circle, if you reckon it fum the call or welt ; or elfe between the meridian and the plane, if you account it from the nurth or fouth. See Dial.

DECLINATORIES, are infruments for takirg the decliuations, inclinations, and rectinations of planes; and they are or feveral kinds.

The beit furt for taking the dectination confifts of a fquare piece of brafs or wood, with a limb accenately divided into degrees; and every fifth minute, if pulfible, having a horizontal dial mosing on the contre, made for the latitude of the piace it io to forve in; and which has a fmall bit of fine brafs tixed on its meridian lime, like a fiducial edge, to cut the degrees of the limb: for at any time when the fun hines, by having the hour of the day, you may find the declination of any wall or plane by this inftrument.

DECLINATURE of Judges. See Law, N ${ }^{5}$ clvi. 12.

DECLIVITY denotes the reverfe of Accuritry.
DECOCTION, ufually fignifies either the action of boiling a fubftance in water, or the water itfelf in which the fubttance has been boiled. It is only appli-

Wechation cable to matters containing fome principles foluble in " water; fuch particularly are animal and vegitable Decoration. matters. Decoction ought not to be ufed with fuch fubfances as contain any volatile principles, as they would be diffipated in the air during the procefs. But it may be fafely ured, nay even becones neceffary, when the matters to be treated are folid, and of a clofe and compace texture; beeaufe then the water could not extract its principles withont a boiling heat. Moft git : nimal matters, as fefh, finn, tendons, may be conveniently boiled in water; becaute they contain no primciple volatile with a boiling heat. Water extracts from them nothing but a gelationous fubftance, and fome oily parts which float on the furface of the water. All vegetable matters which are inodorous, and particularly thofe which are hard, as roots, barks, sce. are generally boiled, when an extraction of their principles by water is required. - To this rule, hovever, there are fome exceptions. Pertvian bark, for intance, gives its flrength to eold water better than to fuch as is boiling hot. Many other vegetables alfo have the fame property of yielding lefs to boiling than to cold water. And therefore a general rule may be eftablithed, that decoction ought not to be employed but when abfoIntely neceffary; that is, when the fane principles, or the fame quantities of thofe prineiples, cannot be obtained by an infution, and chat witiout heat, if it can be fo done, confidering that the proximate principles of vegetables are geneially fo delicate, and io fufceptible of change and decompofition, that frequently the noft genle lieat changes much their nature and properties.
decolintion, beheading, a term feldom Tfed but in the phrafe decollations of St John Baptit; which denotes a paining, wherein is reprefented the Baptilis head fluck of from lis tronk; or the feait held in honour of that martyr.

DECOMPOSITION, in chemitty, ufually figni. fies the difunion or feparation of the conftitnent parts of lodies.-It differs from mere mechanical diviion, in that when a body is chemically decompofed, the parts into which it is refolved are eifentially different from the body itfelf; but though a mechanical force is applied to it ever folong, or with ever fo much violence, the minuteft particles into which the body may be reduced, fill retain their original nature.-Thus, for example, though we fuppofe nitre, or any other falt, to he reduced to ever for tine powder, each particle retains the nature of nitre, as much as the largett unpounded mafs; but if oih of vitriol is applied, a decompofition takes place, and one of the component parts of the nitre rifes in the form of a fmoking acid fpirit, which never could have been furpected to lie hid in the mild neutral falt.

DECOKATION, in architecture, any thin $\begin{gathered}\text { that }\end{gathered}$ adoms and enriches a building, chureh, trimmphal arch, or the like, either without fide or within.

The orders of architecture contribute greatly to the decoration; but then the feverai parts of thofe erders muth have th ir jut proportiuns, characters, and ornaments; otherwife the fineft order will bring confufion rather than rielnefs. See Architecture.

Decorations in churches, are paintings, vafes, feAtoons, \&c. occafionally applied to the walls; and with So manch cenduct and diferction, as not to take of any
thing from the form of the architecture : is is much Deematic practifed ia italy at the folema fealls.

Decoration is more particularly applied to the fcenes of theatres.

In operas, and other theatrical perfurmances, the decorations mult be frequently changed conformably to the fubject.

The ancients had two kinds of decorations for their theatres: the tirit, eaiked arffaliks, having three fides, or faces, which were turned fuccelfively to the fpectators: the other called dutiles, flowing a new decoration by drawing or fliding another before it.- This latter fort is Atll ufed, and apparently with much greater fuceeis than among the ancients, who were obliged to draw a curtain whenever they made a change in the decoration; whereas on our itage the change is made in a moment, and almolt without being perceived.

DECORUM, in architectare, is the fuitablenefs of a building, and the feveral parts and ornaments thereof, to the tlation and occalion.

DECOUPLE, in heraldry, the fame as uncoupled: thus a chevron decouple, is a chevron wanting fo much of it towards the point, that the two ends tand a: a diflance from one another, being parted and uncoupled.

DECOY, in naval affairs, a flratagem employed by a thip of war to betray a veffl of inferior furce into an uncautious purfuit, till the has drawn her within the range of her cannon, or what is called within gany/hot. It is ufually performed by painting the ftern and fides in fuch a manner as to difguife the fhip, and reprefent her either much finaller and of inferior force, or as a friend to the hollile veffel, which fhe endeavours to enfnare, by affiuming the emblems and ornaments of the ation to which the ftranger is fuppofed to belong. Where the has thus provoked the adverfary to chafe, in hopes of acquiring a prize, fhe continues the decuy, by fireading a great lail, as endeavouring to efcape; at the fame time that her courfe is coniderably retarded by an artful alteration of her trim till the enemy approaches. Decoring is alfo performed to elude the chafe of a mip of a fuperior force in a dark might, by throwing out a lighted calk of pitch into the fea, which will burn for a confiderable time and mifguide the enemy. Immediately after the cafk is thrown out, the fhip changes ler courfe, and may ealily efcape if at any tolerable diftance from the foe.

Decoy, among fowlers, a place made for catching wild-fuwl. A decory is generally made where there is a large pond furrounded with wood, and beyond that a marthy and uncultivated country: if the piece of waler is not thus furrounded, it will be attended with the noife and other accidents which may be expected to frighten the wild-fowl from a quiet haunt, where they mean to fleep, during the day-time, in fecurity. If thefe noifes or difturbances are wilful, it hath been held that an astion will lie againtt the difturber.-As foon as the evening fets in, the decoy rifes (as they' term it), and the wild fowl feed duing the night. If the evening is fill, the noife of thcir wings, during their flight, is heard at a very great diftance, and is a pleating though rather melancholy found. This rifing of the decoy in the evening, is in Somerfethire called radiring.

## D E C [ 7031$] \quad D E C$

The decoy-ducks are fe? with hempfeed, which is thrown over the fireens in fmail quantities, to bring them firwards into the pipes or eanals, and to allure the wild fowl to follow, as this feed is fo light as to float.

There are feveral fipes, as they are ealled, which lead up a narrow ditel that clofes at lall with a funnelnet. Over thefe piges (which grow narrower from their fint entrance) is a continued arch of netting fulpended on hoops. It is necelfary to have a pipe or ditch for alnof every wind that can blow, as upon this circumifance it depends which pipe the fowl will take :o; and the decoy man always keeps on the leeward fide of the ducks, to prevent his eflluvia reaching their fagacious noftrils. All along each pipe, at certain iutervals, are placed fireens made of reeds, which are fo fituated, hat it is impoffible the wild-fowl flould fee the decoy-man, before they have paffed on towards the end of the pipe, where the purie-nt is placed. The inducement to the wild-fowl to go up one of thefe pipes is, beeaufe the decoy-ducks trained to this lead the way, either after hearing the whifte of the decoy-man, or enticed by the hempfeed; the lat. Iter will dive under water, whillt the wild-fowl ly on, and are taken in the purfe.

It often happens, however, that the wild-fowl are is fuch a tate of deepinefs and dozing, that they will not follow the deeny-ducks. Ule is then generally mare of a dot, who is taught his leffon: he pafies backwards and forwards between the reed flevens (in which are little holes, both for the deeoy-man to fee, and the little dog to pafs through); this attracts the eye of the wild.fowl, who, not ehoofing to be interrupral, advance towards the fmall and contemptible amimal, that they may drive him away. The dog all the tinse, by the direction of the decoy-man, plays annong the fkreens of reeds, nearer and nearer the purfe-net; till at latt, perliaps, the decoy-man appears bchind a fkreen, and the wild fowl not daring to pals by him in return, nor being able to efcape upwards on aecount of the net-covering, rufh on into the purfe-net. Sometimes the dog will not attract their attention, if a red handkerchief, or fomething very fingular, is not put about him.
The gencral feafon for eatching fowl in decoys, is from the latter end of October till February : the taking of them earlier is probibited by an act io Geo.II. c. 32. which forbids it from June if to October ift, under the penalty of five fhillings for each bird deftroyed within that fpace.

The Lincolnfitire deeoys are commonly fet at a eertain annualrent, from 5 to 20 pounds a-year: and there is ons in Somerfethire that pays 301 . The former contribute principally to fupply the markets in London. Amazing numbers of ducks, wigeons, and 'emnant's teal, are taken: by an account fent us * of the number it. Zoo? caught a ferw winters palt, in one feafon, and in only ten decoys, in the neighbourhood of Wain-feet, it appeared to amount to 31,200 , in which are included feveral other fpecies of ducks: it is sho to be obferved, that, in the above particular, wigen and teal are reckoned but as one, and coniequently fell but at half price of the ducks. This quantity makes them fo cheap on the fpot, that we have been affured, feveral decoy-men would be content to contrast for ycars in deliver their ducks at Boftun, Eor iod. per couple. The aceount of
the numbers here mentioned, relates only to thope that were fent to the capital.

It was cultomary formerly to have in the fens an annual driving of the young ducks before they took wing. Numbers of people iffembled, who beat a vaft tract, and forced the bids into a net placed at the fpot where the fport was to terminate. A hundred and fifty dozens lave been taken at onee: but this prakice being fappeled to be detrimental, has beer abolifhed by act of parliament.

DECREE, an order made by a fuperior power for the regulation of an inferior.

Decref, in the civil law, is a determination which the emperor pronounees upon hearing a particular caufe between the plaintiff and defendant.

Deckars of Councils, are the lawa made by them, to regulate the doctrine and policy of the church.

Decrefs in Cbancery, are the determination of the lord-chancellor, upon a full learing of the merite of a. caufe.

DECREET', in the law of Scotland, a final decree or judgment of the lords of feffion, from which an appeal only lies to parliament.

Deckebt-Arbitral, in Scots law, the rentence or judgment of one to whom parties voluntarily fubmit the determination of any queftion betwixt them *.

DECREMENT, in heraldry, fignifies the wane of ${ }^{\circ}{ }^{\circ}$ claxx. the moon from the full to the new. The moon in this 15 . tate is called moon decrefient, or in decours; and when borne in coat-armour, faces to the left lide of the efcutcheon, as the dows to the right fide when in the inerement.

DECREPITATION, in chemitry, fignifies the quick $\{$ eparation of the parts of a body, oceafioned by a flrong heat, and accompanied with noile and erackling. This effect is moll frequently produced by water contained betwixt the parts of the decrepitating body, when thefe parts have a certain degree of adhefion together. This water being quiekly reduced into vapour by the heat fuddenly applied to it, rarifies, and burfs with noife the parts which comprefs it. The bodies moft fubject to decrepitation are certain falts, fuch as common falt, vitriolated tartar, nitre of lead, \&c. the decrepitation of all which proceeds from the water of their crytallization. Clays which are not perfectly dry, and fints, are alfo fubject to decrepitation.

DECREPITUDE, in niedicine, the confequence of the infirmilies of old age; which by degrces leads to death. See Death.

DECRETAL, in the eanon law, a letter of a Pupe determining fume point or quition in the ecclefiaftical law. The deeretals compole the fecond part of the canon law. The firft genuine one, acknowledyed by all the learned as fuch, is a letter of Pope Siricius, written in the year 385 , to Himeras bifhop of Tarragona, in Spain, coneerning fome diforders which had crept into the churches of Spain. Gratian publinhed a colleetion of decertals, containing all the ordinaners made by the popes till the year 1150 . Gregory 1x. in 1227 , following the example of Theol fius and J10ftinian, formed a conftitution of his own, colle Ging into one hody all the decifions and all the caufes which ferved to adrance the papal power: whichertlection of deretals was called the grnuteas, becaule it containe five burber

DECUMARLA.

## D E C

Decunria DECUMARIA, in botany: A genus of the mono$\underbrace{\text { Dedication, }}$ gynia order, belonging to the dudceandria clafs of plants; and in the natural method ranking under thofe of which the order is doubtful. The calyx is decaphyllous, fuperior ; the petals ten; the fruit unknown.
DECUMATES Agri, tithed fields, or granted on a tithe, as appears from Tacitus, to that rabble of Gauls who fucceeded the Marcomanni, that had till then proved a check to the Roman conquets up the Rhine; and hence probably their name, people living on the marches or limits of the empire. In Cicero we have Ager Decumans, which is of the fame import with the Ager Decumas of Tacitus.
DECUPLE proportion, that of ten to one.
DECURIO, a futaltern officer in the Roman armies. He commanded a decuria, which confifted of ten men, and was the third pait of a turma, or the 3oth part of a legio of horfe which was compofed of 380 men. There were certain magiflrates in the provinces called decurions municipales, who formed a body to reprefent the Roman fenate in free and corporate towns. They confilted of ten; whence the name and their duty extended to watch over the interefls of their fellow citizens, and to increafe the revenues of the commonwealth. Their court was called curia decurionum and mivor fonaius; and their decrees, called decreta deariormu, were marked with two D. D. at the top. They generally ftyled themfelves civitatam patres curriates and honorati municipiorum fenatores. They were elected with the famc ceremonies as the Roman fenators; they were to be at leatt 25 years of age, and to be poffeffed of a ectain fum of money. The election happened in the kalends of March.
decurrent leaf. Sce Botany, p. 440.
DECURY, ten perfons ranged under one chief or $l \in a d e r$, called the decurio.

The Roman cavalry was divided into decuries, which were fubdivifions of a century, each century containing ten decuries.
DECUSSATION, a term in geometry, optics, and anatomy, fignifying the croffing of two lines, rays, or nerves, when they meet in a poist, and then go on feparately from one another.

DECUSSORIUM, a furgeon's inftrument, which, hy preffing gently on the dura mater, caufes an evacuation of the pus collected between the cranium and the before mentioned membrane, through the perforation made by the trepan.

DEDHAM, a town of Effex in England, confiting of about 400 lofty houfes. The theets are not paved, but very flean, occafioned by their lying pretty high. It has one large old church, remarkable for a fine Gothic fleeple, with a great deal of carved work about it, but much injured by time. E. Long. i. 10. N. Lat. 52.5 .

DEDICATION, the aEt of confecrating a temple, altar, ftatue, palace, \&c. to the honour of fome deity.

The ufe of dedications is very ancient both among the worfhippers of the true God and among the heathens: the Hebrews call it חas bbanuuchal," "imitarion ;" which the Greek tranflators iender Eixavia, and Eixewis $\sigma \mu)_{5}$, "rencwing."

In the fcripture we meet with dedications of the tabernacle, of altars, of the firt and fecond temple, and even of the houfes of private perfons. There are alio
$\mathrm{N}^{\circ} 98$.

704 D E C
dedications of veflels, and garments of the priclts and Levites, and cven of the mea themfelves.

The heathens had alfo dedications of temples, altars, and images of their gods, \&c. Nebuchadnezzar held a folemn dedication of his flatue, Dazl. iii 2. Pilate dedicated gilt bucklers at Jerufalem to Tiberius, Pbilo de legat. Perronius would have dedicated a ftatue to the emperor in the fame city, ibid. p. 791. Tacitus, Hij2. lib. iv. c. 53. mentions the dedication of the capitol, upon rebuilding it by Vefpafian, scc.

The Jews celebrated the anniverfary of the dedication of their temple cevery year for eight days. This was firt enjoined by Judas Maccabeus, and the whole fynagogue, in the year of the Syro-Macedunian era 148 , i.e. 164 years before Chrift. The heathens had the like snniverfaries, as that of the dedication of the temple of Parthenope, mentioned by Lycophron. Under Chrifianity, dedication is only applied to a church ; and is properly the confecration thereaf performed by a bilhop, with a number of ceremonies prefcribed by the church.

The Chriftians finding themfelves at liberty under Conftantine, in lieu of their ruinous churches, built new ones in every place; and dedicated them with a deal of folemnity. The dedication was ufiaily performed in a fynod; at leaft they afembled a number of bilhops to affitt at the fervice. We have the defription of thofe of the churches at Jerufalem and Tyre in Eulcbins, and many others in later writers.
Dedication, in literature, is an addrefs prefixed to a book, foliciting patronage, or tettifying refpect for the perfon to whom it is made. The dedication of the fourth part of Mr Edwards's Hiftory of Dirds, is curious: To God! the one eternal! the inconprebenfitle! the omniprefont! omnificunt and almigbty Creator of alt things that exift from orbs inmeafurably great to the nuitutefl points of matter, this Atom is dedicated and devoted, ruith all poffible gratituld, bumiliation, and zuar hip, and the bigheft allcration both of lody and mind, by bis magh refigned, low, and humble cocature, G. E.
DEE (John), a fanous mathematician and aftrologer, was born (July 1527) in London, where his father was a wealthy vintner. In 1542 , he was fent to St John's college, Cambridge. After five years clofe application to nathematical ftudies, particularly aftronomy, he went to Holland, in order to vifit feveral eminent mathematicians on the continent. Having continued abroad near a year, he returned to Cambridge; and was there elected one of the fellows of Trinity college, then firt erected by king Henry VIII. Ia $154^{8}$, he took the degree of mater of arts; and, in the fame year, left England a fecond time; hic flay at home being rendered uneafy to him, by the fufpicions that were entertained of his being a conjuror ; arifing partly from his application to aftronomy, but efpecially on account of a piece of machinery in the Eifyny of Ariflophanes, which he exhibited to the univerfity, and in which he reprefented the Scarabeus flying up to Jupirer, with a man and a balket of victuals on its back. Thefe fufpicions he could never after thake off: nor did his fubfequent conduct, as we fhall fee, tend to clear him of the imputation; for if he was not actually a conjuror, it was not for want of endeavours.

Upon Ieaving England, he went to the univerity of Louvain; where he was much efteemed, and vifited by
feveral

## D E E

Dee．Teveral perfons of high rauk．Here he refided about two years，and then fet out for krauce；where，in the college of Rheins，he read lectures of Euclid＇s etements with valt applaufe．In 1551，he returned to Eughand， and was introduced by the lecretary Cecil to king Ed－ ward，who affigned him a penfion of 100 crow ni，which he afterwards relinquified for the rectory of Upton upon Severn：but foon after the accefion of quect Mary，having forne corrcfpondence with the lady Ehi－ zabeth＇s fervants，he was accufed of practifing againf the queen＇s life by enchantment．On this account he fuffered a tedious confinement，and was feveral times examined；till，in the year 1555，he obtained lis li－ berty by an order of conucil．

When queen Elizabeth afcended the throne，our aftrological Dee was conimled by lord Dudky，con－ cerning a propitious day for her majelly＇s coronation． He was on this occafor introduced to the queen，who made him great promifes，which were never performed， though the condefeended to receive his inftruttions re－ lative to the myitical interprctation of fome of his un－ in elligible varitines，which he publified about this time． In 1564，he made another voyage to the contiment； in order to prefent a bock which he had dedicated to the emperor Maximilian．He returned to England in the fane year；but in 1571，we find him in Lorrain ； where，being dangeroully ill，the queen fent over two phyficians to his relief．Iaving once more returned to his native conatry，he fettled at Mortlake in Surrey， where he continued his itudies with unremiting ardor， and eolleeted a confiderable library of curious books and manufcripts，with a variety of intruments；mort of which were afterwards dettroyed by the mob，as belenging to one who dualt with the devil．In 1578 ， the queen being much indifpofed，Mr Dee was fent a－ broad to confult with German phyieians and philofo－ phers（aftrolaters no doubt）on the occation．We now behold him again in England，where he was foun after emplayed in a more rational fervice．Her ma－ jelty，defirous to be informed enncerning her title to thofe countries which had been difcoveral by her fub－ jeets，commanded Mr Dee to confult the ancient re－ cords，and furnifh her with proper geographical de－ feriptions．Aecordingly，in a flort time he prefented to the queen，in the gardens at Riclmond，two large rolls，in which the difeovered countries were geogra－ plically deferibed and hiftorieally illuftrated．There rolls are preferved in the Cotton library，Auryhus I． His next employment was the refurmation of the ka－ Indar，on which futije er he wrote a rational and lean－ ed treatife，prefesved in the Athmulcan libray at Ox－ ford．

1 Lithertc the extravaganeies of our creentrical phi－ lofupher feem to have been connterpoifed by a tolerable proportion of reafon and fcience ；but henceionnard we contider him as a mere necromarear and eredulons al． chymit．In the year 1585，he became acquainted with one Edward Kelley，by whofe affiltance he per－ formed diverfe incantations，and maintained a frequent inaginary intercnurfe with fpirits．He was particn－ lary intimate，it feems，with the angels Raphat and Gabriel．One of them made him a profent of a black Ipcculum，in which lis angels and demons appeared as often as he had occalion for them；they ahwered Vok．V．Part II．
his quellions，and Relley＇s bufinefs was to record the＇r dictates：

Ficlley did all his feate upon
Thc deva＇：lowking giat：a linne

In 158 ，they were both introdeced to a cortain Po－ lifh nobleman，then in Gondand，wamed Allew Ind⿸⿻一丿又子， palatine of Siradin，a perfen cipally addioted to the fanc ridiculous purfuits．He was for charmed with Dee and his companion，that he perfuaded them to aso company him to his mative coment．＇They cubarked for Holland in Sept． $15 \%$ ；and tranding over land， arrived at the town of Lafki in Polruary following． Their patron，however，finding himfelf abufd by weir idle pretentions，perluaded then to pay a vilit to doo doiph king of Bohemia；who，hough a ciedolous man，was foon difguld with their nomfonf．They were afterwards introduced to the king of Poland，bus with no better ficecfs．Soom after this，they wen？ invited by a rich Bohemian nothenan to his cattle on Trebona，where they continued for fome time in gres？ afluence：owing，as they afferten，to their art ot tranfinutation by mans of a centan powder in the pofledion of Kelly．

Dce，now quarrelling with lis companion in iniqui－ ty，quitted Bohemia，and returned to England，whe： he was once more gracioufly received by the quen； who，in 1595，made him waden of Manchefler cob－ lege，in which town he relided feveral years．In 1604 ， he returned to his houle at Murtlake，where he died in the year 1609 ，aged 81 ；leaving a large family， and many works，behind lian．－The back tone into which lee ufed to eall his fipirits，was in the collec－ tion of the earls of Peterborough，whence it came to lady Elizabeth Germaine．It was nest the property of the late duke of Argyle，and is now Mr Walpole＇s． It appears upon examination to be nothing but a po－ lubed piece of cannel－cual．．．．That Dee was a man of confiderable acquirements，is beyond a doubt；his mathematical knowledge is generally allowed：but， unicfs we fuppofe him a wicked impoltor，which is by no means improbable，we muft tranfenit him to pol－ terity as one of the molt foolith，fupertitions，necron mancers of his time．Neverthelefs，the cellumated Dr Hook，many years after Dec＇s death，took it into his head to prove that his journal，putilithed by Cafaubm， was entirely cryptographical，concealing his political tranfactions，and that he was employed by caven Eli－ zabeth as a Ipy．

DEE，the name of feveral rivers in Scotland and England；as thofe whereon the citios of Chefer in Lughand，and New Aberden in Seotland，are litua－ ted．The river Dee in Aberdechlhire abounds with falmon，fo as to form one of the greatell famm－fith－ ings in Scotland．－Over hif river there is a bridge of feven arehes，built by a bihop of Abertech，who left for its fupport a revenuse，which is now fo large，that in order to exhault the fund，a perfon has a falary to fweep the bridge once a－day．

DEED，an influment intiten on paper or parels． ment，comprehending fome contract，baygain，or agree－ ment between the partics thereto，in rdation to the matter therein contained．

DEEMSTERS，or Demsters；（from the Saxom $4^{!}$dima，

# D E F 

Deeping dena, judge or umpire). All controverfies in the Ife Defecate. of Man are decidel without procefs, writings, or any charges, by certain judres, choten yearly from among themifives, called deemfitrs; there being two of them for cach divifion of the ifland: they fit judges in all courts. either for life or property; and with the advice of $2+$ keys, dechare what is law in uneommon emergencies.

DEEPING, a town of Lincolnthire in England, feated on the river Weland, in a feany greund. W. Long. O. 20. N. Lat. 52. 35 .

DEER, in roology. Se: Cerrus.-The mathod of hunting deer in the indand of Ceylon is very particular. The humtimen go out in the night, and only two ufually go together: the one of thefe earries upon his head an earthen veffel, in which there is fome fire burning and flaming; the ingredients are generally fmall flicks cut into pieces, and common rofin. Of this the other man earries a fupply about him to replenifh the pot when it grows low. The perfon who has the fire upon his kead, carries in one hand a ftaff, on which there are fixed eight bells; and the larger thefe are, the better. This man goes firlt into the woods, and the other follows clofe behind with afpear in his hand. As foon as the deer hears the noife of the belis, he turns towards the place whence the found comes; and feeing the fire, he eagerly runs up to it, and fiand gazing at a fimall difance: the fecond man has then nothing to do but to kill him with the fpear; for he fees neither of them.- Not only deer, but even clks and hares, are thus taken; for they gaze at the fire, and never fee the men. The profits of this fort of hunting are very large, and the danger nothing ; for though there are numbers of tygers, elephants, and wild boars, in thefe woods, the huntfmen are in no danger from them while the fire burns, for they all run away from it.

DE facto, fomething actually in fact, or exifing; in contradiftinction to de jure, where a thing is only fo in jultice, but not in fact: as a bing de fưto, is a perfon who is actually in poffeftion of a crown, but has no lugal right to the faine; and a king de jure, is the perfon who has a juft right to the crown, though he is out of porfeffion therof.

DEFAMATION, the fecaking flanderous words of another; for which the ilanderer is punifhable, aecording to the nature of his offence, either by action upon the cafe at common law, or by fratute in the ecclefrattical court.

DEFAULT', in law, is generally taken for nonappearance in court, at a day afligned; but imports any oniffion of that which we ought to do, for which judgment may be given againte the defaulter.
idefeasance, or Defeisance, in law, a condition relating to fome certain deed, which being performed, the deed is defeated and rendered void, as if it had never been made. The difference between a common condition and a defeafance is, that the condition is annexed to, or inferted in, the deed; and a defeafance is a deed by iffeif, concluded and agreed on between the parties, and having relation to another deed.

DEFECATE, in chemifry, a term applied to a boly freed and purged from frees and impuritics.

DEFECTION, the act of abandoning or relin- Defeatio quilhing a party or interelt a perfon had been engaged in.-The word is formed of the Latin deficio, to fall off.

DEFECTIVE, in general, an appellation given to things which want fome of the properties that naturally they ought to have. Thus,

Defective or Deficicint Nouns, in grammar, are fuch as want either a whole number, a particular cafe, or are totally indeelinable. See Noun.

The term defeative is alfo applied to a verb that has not all its moods and tenfes. See Verb, Mood, \&e.

DEFENCE, in fortification, all forts of works that cover and defend the oppofite pofts, as flanks, cafements, parapets, and fauffebrays. See Fortification.

Line of Defence, a fuppofed line drawn from the angle of the curtin, or from any other part in the curtin, to the flanked angle of the oppofite battion.

DEFEND, in general, fignifies nuch the fame with protecting, or keeping of injuries offered to any perfon ether by enemies or otherwife.

Defend, in our ancient laws and flatures, fignifies to prohibit or forbid: as, Ufuarios defendic quogue rese Edwardus ne remanerent in regno. L. L. Edw. Conf. c.37. E 5 Rich. 2.c.7. In which Fenfe Chater alfo ufes it in the following paffage:
"Where can wou fay in any manner age,
In 7 Edw. I. there is a flatute intitled, "Stututum de defentione portandi arma," \&c. And "it is defended by law to diftrain on the highway;" Coke on Lith. fol 161.

DEFENDANT, in law, the perfon fued in an action perfonal ; as terant is he who is fued in an action real. See Aefion.

DEFENDER of the Faith (Fidei D-fenfor), a peculiar tithe belonging to the king of England; as Catholicus to the king of Spain, and Cbrificuilifimus to the king of France, sc. Thefe titles were given by the popes of Rome. That of Fidid Defenfor was firt conferred by Leo X. on king Henry VIII. for writing aqaint Martin Luther; and the bull for it bears date quinto idhus 0,706 . 1521 . It was afterwards cenfirmed by Clement VII. But the pope, on Henry's fuppreffing the houfes of religion at the time of the Reformation, not only deprived him of his title, but depofed him from his crown alfo: though in the 35 th year of his reign, his title, \&c. was confirmed by parliament ; and hath continued to be ufed by all facceeding kings to this day.- Chamberlayne fays, the title belonged to the kings of England before that time; and for proof hereof appeals to feveral charters granted to the univerfity of Oxford. So that pope Leo's bull was only a renovation of an aneient right.

DEFENDERS, were anciently notable dignitaries both in elurch and flate, whofe bufinefs was to lools to the prefervation of the public weal, to protect the poor and helplefs, and to maintain the inte1efts and caufes of churches and religious houfes. See Protector. - The courcil of Chalcedon, can. 2. calis the defender of a chureh Exiroos Codin, de offriis aulc Confl. makes mention of defenders of the palace. There were alfo a defender of the kingdom, defonfor

## D E F

## D E F

ders of the people, difinfores pletis; of the poor, fatherlefs, widows, sc.

About the year 4.20, each patiarchal church began to have its defender; which cullom was afterwards introduced into oher churches, and contimus to later days mender other names; as thofe of Adrocate, and silluaver.

In the year 407, we find the council of Carthage aking the emperor for defenders, of the number of Scholafici, i. e. advocates who were in office; and that it might be allowed them to enter and fearch the cabinets and papers of the judges and other civil magiftrates, whenever it nould be found neceffary for the intereft of the church.

DEFILE, in fortification, a ftrait narrow paffuge, through which a company of horfe or foot can pafs only in file, by making a fmall front.

DEIINI'LE, in grammar, is applied to an article that has a precife determinate fignification; fuch as the article the in Englih, le and la in French, \& co. which fix and afcertain the noun they belong to, to fome partieular; as the king, le roy: whereas, in the quality of king, de roy, the articles of and de mark nothing precife, and are therefore inderinite.

IDEFINITION, in general, a fhot defeription of a thing by its properties; or, in logic, the explication of the effence of a thing by its kind and difference.

DEFINITIVE, a term applied to whatever terminates a proceds, queltion, \&x.; in oppolition to provifromal and interlocutory.

DEFLAGRATION, in chemiltry, the kindling or fetting fire to a falt or mineral, \&c. either alone or mixed for that purpofe with a fulphureous one, in order to purify it.

This fort proeefs has been often recommended to the world as of great ufe in trying the Arength of brandies and other vinous firits, and has been greatly improved in this refpect by Mr Crooffroy.
'The common way of trying fpirits by deflagration, is to meafure out any quantity of it, then to leat it, and fet it on lire. If, after it will no longer burn, the remainder is half as much as the quantity meafured out for the trial was, then the fpirit tryed is found to confift of half water, and half totally inflammable fpirit; that is, it is fomewhat below what we underitand by the term perfect proof. - This method is much more certain than that by the crown of bubbles which arifes upon flaking the fpirit in a vial. Monf. Geolfroy's method is this: 'Pake a cylindrie veflel two inches high, and as much in diameter, confiting of thin plate fiver, that metal being much lefs liable to ruft than copper; this veffel mutt be fitted with a little rectangular gage exactly graduated into lines, half lines, \&xc. then the veffel being fet level upon a copper eafe made to contain it, a pareel of the brandy to be examined is poured in, to the leight of 16 lines. 'Thisheight is to be exactly hit by pouring in more than enough at firt, and then lincking ont the owerplus with a very farall tubs. Then the vellel leciag heated a little, fo as juft to make the liquor fume, it is to be fet on fire, and left to go out of itfulf; at the inftant when the fane expires, the gage is phonged perpendicularly into the veftel, and the lines and quarters cxactly noted
which the liquor wants of its former height: this dif. Deffection furnce gives the preeife quantity of alcohol or pure frinit contaned in the liquor. Thas, if eight lines of phlegn are found remaining, this being the half of the 16 lines of the original filling, it is plain, that the liquor contained onc half fpirit, or was fomething below poof. If only four lines remained, it was nearly double proof, or of a middle nature betwixt alcohol and common proof-fpirit.

DEFLECIION of the Rars of Liout, a property which Dr Hook obferved in 1675 , and read an account of before the Royal Society, March 18, the fame ycar. He fays he found it different both from reflection and refraction, and that it was made towards the furface of the opaque budy, perpendicularly. This is the lame property which Sir lface Newton calls Inflection.

DEFLORA'TlON, or Deflowiring, the adt of violating or taking away a woman's virginity. Sec Varginity. - Death, or marriage, are deered by the civil law in cafe of defloration.

The ancients had fo much refpect for virgins, that they would not put them to death till they had firt procured them to be deflowered. It is faid, the natives of the coalt of Malabar pay ftrangers to come and deflower their brides.

In Seotland, and the northern parts of Eugland, it was a privilege of the lords of the manor, granted them by king Ewen, that they thould have the firt night's lodging with their tentants wives. King Malcolm III. allowed the tenants to redeem this fervice at a certain rate, called marclath, conifting of a certain number of eows: Buchanan fays it was redeemed with half a mark of filver. The fame cuftom had place in Wales, Flanders, Friefcland, and fome parts of Germany.

DEFLUXION, in medicine, the falling of the humours from a fuperior to an inferior part of the body.
1)E FOE (Danitl), a writer famous for politics and poetry, was bred a hofier; which profetion however he foon forfook, and became one of the molt cnterprifing authors that any age produced. When difcontents ran high at the Revolution, and king Willian was obliged to difmifs his Ducth guards, De Foe, who lad true notions of civil liberty, ridiculed the enemies of government in his well-know poen, called The Trueborn Englifloman, which had a prodixious falc. The next fatire he wrote was incitled, Reformation of Blanuers; ained at fone perfons of high rank, who rendered themielves a difgrace to their country. When the ecelefiatics in power breathed too much of a pirit of perlecution, De Foe wrote a tract called The Sbor:glt ${ }^{\prime}$ ray with the Diflenters; for which he was called to account, and explained himfelf with great firmnefs. He was afterward fentenced to the pillory for attacking forme public meafures; which follittle intimidated him, that, in defance of their ufage, he wrote $A$ Hymen to the Piliory. It would be endlefs to enumerate all his publications; hut the following are the prineipal: The Hiflory of the Phegue in 1665 ; a novel intitled The Hiflory of Colonel Faik; A wew Vajage rount the Worid by a Company of ALerchants, printed for Bettefworth, i 225 ; The Hiflory of Rovana; Memoirs of a Cavalier: The Hillory of Moll Fiunders; a book intitled Refgious Court/hit, which has undergone upwards of $20 \mathrm{cdi-}$ tions; and the Life and Aldomures of Robingon Crafor,

# D E F 

Defoliation:an admirable porformance, of which there have been cuitio:s whithout number, but concerning which there is an ancelote that does the author of it no credit as to the better part of a "riter's claracter, honcity. When captain Wrods Rogers touched at the ifland of fuan Iomandez, in the South Sea, he brought away Alexunder Salkirk, a Scots failor, who had been left athore there, and had lived on that defolate Flace abure four years. When Selkirk came back to England, he wrote a narative of his adventures, and pit the papers into the hands of Ine Foe, to dipelt for publication; who ungeneromfly converted the materiais iatu the Alitory of Robinfon Crufue, and recumed Solkirk his papers again! A fraud for which, in a humane veew, the ditinernifned merit of that romance can never atone. Diniel de Foe died at Jilington, in 173:. All his productions of the romantic frecies, but efpecially the two but mentionad, are much in woul amongt comntry readors; and, on acconnt of their moral and relgious tendency, may very probably in fome incafure combteact the pernicious effects produced by the too general circulation of modera nuxcis, thote occational vehicles of impiety and infidelity.

DEEOLTATION, (from de, and folium a laf); the fall of the leaves. A icm oppofed to fiomaciontion, the ammal renovation of the kaves, produed by the unfoldiag of the buds in ipring. See Frondeserntia.

Wolt plants in cold an? temperate climates thed their Jeaves every year: this happens in antuma, and is gemenally anounced by the fowering of the common meadow fafiron. The term is only applied to trees and thrubs; for herbs perih down to the root every year, lofing item, leaves, and all.

All phats do not drop their leaves at the fame time. Among large tress, the afl and walnut, although lateit in unfolding, are fooncit divelted of them: the later fshom carries its leares above dive months.

On the oak and horn-beam, the leaves die and wiQher as foon as the colds commence; but remain attached to the branchas till they are purfied off by the new ones, which untold thenvelves the following fpring. '1hele trees are douthtefs a kind of evergicens: the leaves are probably dellroyed only by cold; and perhaps would continue longer on the plant, but for the force of the fpring-rap, joined to the moiture.

In mild and dry feafons, the lilae, privet, yollow jeffamine of the woods, and naple of Crute, preferve their leaves green until foring, and do not drop them till the new leaves are beginning to appear. The hig-tree, and many other trees that grow between the tropics, are of this particular clafs of ever-greens. The trees in Egypt, fays Doctor Haffelquit, caft their keaves in the latter end of December and beginning of January, having young leaves ready before all the ohd ones are fallen off; and, to forward this operation of nature, few of the trees have buds: the fycamore and willow, indeed, have fome, but with few and quite loofe fitpula or feates. Nature did not imagine buds fo neceflary in the fouthern as in the northern countries; this occafoons a great difference between them.

Latty: fome trees and forubs preserve their leaves
conflantly through the whole year: and are not in the Defoliation lealt infleneed by the clemency or inclemency of feafons. Such are the firs, juniper, yew, cedar, cyprefs, and many other trees, hence denominated ever-grecns. Thefe preferve their old leaves a long time after the formation of the new, and do not drop them at any determinate time. In general, the leaves of ever-guens are harder, and leis fucculent, than thofe which are sonewed annually. The trees are gencrally natives of warm climates; as the alatemnfes of France and Italy, the ever-green oak of Portugral and Suabid.

Some herbaceous perennals, as the houfe-lecks and navel-worts, enjoy the fame privilege with the ever. gresu tiets, and refit the feveritios of winter: fome even ean difurnfe with the earth for tome time; being replete with juices, which the leaves imbite fiom the humidity of the atmofphere, and which, in fuch plants, are, of themfelves, fafficient for effectia; the purpures of vegetation. It is for this reaion, that, ankis in exceflive hot weather, gardeners are fellom wont to water fat fueculent plants, as the alors, which rot when they are moilened, if the fun does not quickly dry them up.

The leaves of all the ever-green fhrubs and trees, ha:c a thin compact fkin or cover over their furface; as is eafily difcovered by macelating them in water, in order to feparate the parcuchyma, or pulp, from the veflels of the leaves; which cannot be effected in any of thefe ever-greens till a thin parchment-like cover is taken off. Thefe trees and thrubs are found by experiment to perfpire but little, when compared with others which thed their leaves; and it is, perhaps, principally owing to this clofe covering, as alfo to the fmall proportion of moiture contaned in their velfels, that they retain their verdure, and continue through the winter on the trees. The nutritive juices of thele plants ahways abound, more or lefs, with an oily quality, which fecures them from being injured by fevere frons ; fo that many of thefe ever-green trees are adapted to grow in the coldelt parts of the habitabie world.

With refpect to deciduous trees, the falling off of the leaves feems paincipally to depend on the temperature of the atmofphere, which likewife ferves to hatten or retard the appearance in queftion. An ardent fun contributcs to hatten the dropping of the leaves. Hence in hot and dry fummers, the leaves of the limetree and horfe-chefnut turn yellow aboat the brit of September; whit in other years, the yellownefs does not appear till the beginning of October. Nothing, however, contibutes more to halten the fall of the leares, than immoderate cold or moits weather in autumn; moderate droughts, on the other hand, ferve to retard it. As a proof of this polition, Mr Adanfon. relates, that in the year 1750 , the leaves of the elmtice, which generally fall off about the $25^{\text {th }}$ of November, continued in verdure and vigour at Paris, where the autumn was remarkably dry, till the 10 th of the following month.

The following table, refpecting the mean times in which different trees thed their leaves, is founded upon obfursations.

Goofe:

## 1) E F

efoilation Goofeberry-tree and bladder-
11 Cena,
Jeformity Walnut and afh,
Almond-tree, horfe-chefnut, and lime-tree,
Maple, hazk-nut, black poplar, and afpen-tece,
Birch, plane-tree, mountainofier, falfe-acacia, pear, and apple-tree,
Vine, mulberry, fig, fumac, and angelica-tree,
Eln-trce and willow,
Apricot and elder trees,

November ift. Ioth. 15 th.

It deferses to be remarked, that an ever-green tree grafted upon a deciduous, detcrmines the datter to retain its leaves. This obleration is confirmed by repeated experiments; particularly ly grafting the laurel, or cherry-bay, an evergreen, on the common cherry; and the ilex, or ever-green oak, on the oak.

DEFORCEMENT, in law, the cafting any one out of his land, or with holding of lands and tenements by force from the right owner.

Deforeement, in Scots haw, the oppoling or refitting of the officers of the law in the execution of their office. See Law, N clxxxvi. 15.

DEFORMHTY, the want of that uniformity neceflary to conflitute the beauty of an object. See Beauty.

Deformity is either natural or moral. Thefe are both referred by Mr Hutchefon to an intermal fenfe; and our perceptions of them, as he fuppofes, arifes from an original abbitrary fructure of our own minds, by which certain objects, when obferved, are rendered the occafions of certain fenfations and affections.

That many objects give no pleafure to our fenfe is obvious. Many are certainly void of beauty; but then, fays this author, there is no form which feems neceffarily difagreeable of itfelf, when we dead no other evil from it, and compare it with nothing better of the kind. Many objects are naturally difpleafing and diftafteful to our external fenfes, as well as others plealing and agreeable ; as finells, talles, and fome feparate founds: but uitb regard to our fenfe of beauty, no compofition of objects which give not unpleafant fimple ideas, feens pofitively unpleatant or painful of it felf, had we never obferved any thing better of the fame kind.

Had there been a fpecies of the form which we now denominate argly or deformed, and had we never feen or expected greater beauty, we fhould have received no difgult from it; though the pleafure would not have been fo great in this form as in thofe we now admire. Our fenfe of beauty feems defigned to give us pofitive pleafure; but not pofitive pain or difgut, any farther than what arifis from difappointment.

There are indeed many faces which at firft view are apt to raife dillike. But this is generally not from any pofitive deformity ; but either from want of expected beauty, or from the carrying fome matural indications of morally bad difpofitions, which we all acquire a faculty of difcerning in countenances, airs, and geftures. That this is not occalioned by any form pofitively difgulting, appears hence, that if, upon long acquaintance, we are fure of finding fweetnefs of tem-

## D E F

per, humanity, and cheerfulnefs, thoush the bodily Defirmity. form continues, it mall give us mo difguit. There are -rherrors raifed by fome wbeets, which are only the effect of fear for ourfelves, or compatlion towards others, when either reafon, or fome foulith attiociation of ideas, makes us apprehend danger; and not the elleet of any thing in the form itfelf for we shd, that molt of thofe objects which excite horror at firt, when experience or teafon has removed the far, may become the occafion of pleafure.

The cafual conjunction of iteas gives us difguf, where there is nothing difagrecable in the for:n itelf. And this, in effect, is the caufe of mof of our tuata. ftic averfions to the fignes of divers animals, 80. Thus ferpents of all kinds, and many iufects, wally beautiful enough, are behed with averfion by many peopte, who have grot fome accidental ideas of nif. chicf affociated to them. A fimilar reafoning is applicd to our perection of moral beauty and deformity.
 pallim.

But it is more jelt to diltinguih between the fenti. ments of delight or difgut, excited in us by beantifui or deformed objects, which are effects of fome caufes, and the natural and real qualities of the perceived objects by which they are produced. There are objects, fays an excellent writer, which have a natural aptitude to pleafe or offend, or between which and the contemplating mind there is a necefary congruity or incon gruity ; and though the actual perception of the undertanding, and confequent feeling of the heart, in contemplating the actions and affections of moral agents, may exit in very different degrees, on account of the incidental obltructions arifing from bodily irdifpofition, mental prejudices and bidffes, and the affuciation of ideas; yet, to every rational mind properly difpofed, monally good actions mult for ever be acceptable. and can never of themfelves offend; and morally cvil actions muft for ever be difargeeable, and can never of themfelves pleafe. What is right in actions and characters is beantiful and amiabie, and gives pleafinc ; what is wrong is deformed and odions, and excites difgult: right and pleafure, weong and pain, are as diltinet as caute and cffect. It is no lefs abfurd to maintain, that the perception of virtue is nothing difinct from the reception of the plafure refuting fiom it, than to infer, with fome metaphyficians, that MJidity, extenfion, and figure, are only particular modes of fenfation, becanf. attended, whenever the are perceivel, with fome fenfations of light or touch. Thus ches this atather how, that moral beauty and deformity are real qualities of certain actions; in which confits theiraptitude so pleate or difgut. With refpect to matural beauty, he obferves, that unifornity anidt variety pleaiks, becaufe of the natures of variety and unifurmity, which are fuch, that whenever united, they are adapted to pleaio every free unbiaffed mind that difeems them. He ascounts for the pleafure they afford, without rfferrint them to an arbitrary internal fenfe, hy the followins circumilances that attend them. They are more eafily conprehended by the mind: order and fymmetry gre things tha ir Rability and ftrength, and fiblemiency to any valuable purpofe; regularity and order evidence art and defign. - Diforder and confulion, whence deformity arifes, denote only the negation of regularity

Deformis.and order; or any arrangement and difpofition of things, which are not according to a law, rule, or plan, and prove not defign. Thefe are not politively difpleafing ; except where we previoufly expected order, or where imputence or want of tkill appear, and the contriver has cither failed of his defign or executed it ill.

In the Furitive Pieces, is preferved an excellent effay on Bodily Deformity by the late William Hay, Efq; who was himfulf what he deferibes, and'who, while he rallics his own figure with great pleafantry, difcuffes the generdl fubject in a manner equally infructive and agreeable. He confiders, i. The natural confequences of bodily deformity; $z$. How it affects the outward cincumftances; and, 3 . What turn it gives to the mind.

1. It is certain, that the human frame, being warped and difproportioned, is leffened in ftrength and acativity, and rendered lefs fit for its functions. Scarron had invented an engine to take off his hat; "and I wiht (fays our anthor) I could invent one to buckle my fhoe, or to take up a thing from the ground, which I can fearce do without kneeling, for I can bend my body no farther than it is bent by nature. For this reafon, when ladies drop a fan or glove, I am not the firf to take it up; and often reftrain my inclination to perform thofe little fervices, rather than expofe my fpider-like flape. And I hope it will not be conftrued as pride, if I do not always rife from my feat when I ought: for if it is low, I find fone trouble in it; and my centre of gravity is fo ill placed, that I am often like to fall back. Things hanging within the reach of others are out of mine; and what they can execute with eafe, I want flrength to perform. I am in danger of being trampled upon or liffed in a crowd, where my back is a convenient lodgment for the elbow of any tall perfon that is near. I can fee nothing, and my whole employment is to guard my perfon. I lhave forbornc to attend his Majelty in the houle of peers fince I was like to be fqueczed to death there againt the wall. I would willingly come thither when his majefty commands, but he is too gracious to expect impulfibilities. Befides, when I get in, I can never have the pleafure of fecing on the throne one of the beft princes who ever fat on it. Thefe, and many others, are the inconvenicnces continually attending a figure like mine. They may appear grierous to perfons not ufed to them, but they grow eafier by habit; and though they may a little difturb, they are not fufficient to deftroy the happinefs of life; of which, at an average, I have enjoyed as great a thare as moot men. And perhaps one proof of it may be my writing this Effay; not intended as a complaint againft Providence for my lot, but as an innocent amufement to myfelf and others."
As to what eflect deformity may lave on the healh, it appears natural to imagine, that as the inward parts of the body mult in fome meafure comply with the outward mould, fo the form of the latter being irregular, the firft camot be fo well placed and difpofed to perform their functions; and that generally daformed perfons would not be healthy or long-lived. Bat this is a quett:on belt determined by facts; and in this cafe the inflances are too few or unubferved, to draw a general conclufion from them: and health is more than
is commonly thought in a man's own power, and the Deformies reward of temperance more than the effect of conflitu. tion; which makes it ftill more difficult to pafs a judgement. LEfop could not be young when he died; and might have lived longer, if he had not been murdered at Delphi. The Prince of Orange fcarce paffed the meridian of life, and the Duke of Luxemburg died about the age of 67 . The Lord Treafurer Burleigh lived to 78 ; but his fon the Earl of Salifbury, who died about 15 years after him, could not reach near that age. It is faid that Mr Pope's father was de. formed, and he lived to 75 ; whereas the fon died in middle age, if he may be faid to die whofe works are immortal. "My father (adds our author) was not deformed, but active, and my mother a celebrated beauty ; and I, that am fo unhke them, have lived to a greater age, and daily fee my acquaintance, of a Htronger frame, quitting the flage before me."

But whether deformity, abitractedly conlidered, be really prejudicial to health, in its confequences it appears to be mott commonly an advantage. Deformed perfons have a lefs thare of ftrength than others, and therefore hould naturally be more careful to preferve it: and as temperance is the great prefervative of halth, it may incline them to be more temperate. Another great prefervative of heallh is moderate exercife, which few deformed perfons can want flrength to perform. As a deformed perfon is not furmed for violent exercife, he is lefs liable to fuch diforders as are the natural confequence of it. He will alfo efcape many accidents, to which men of athletic make, and who glory in their Atrength, are always expofing themfucs to make trial and proof of it. If he cannot carry an ox, like Milo, he will not, like Milo, be handcuffed in the oak by attempting to rend it. He will not be the man that fhall ride from London to York in a day, or to Windfor in an hour, for a wager ; or that thall be perpetually performing furprifing long joumeys in a furpriting fhort time, for no earthly bufinefs but the pleafure of relating them. Confciuus of his own weaknefs, he will be cautious of rumning into places or uccafions of danger. Nature, too, warns deformed perfons to be carcful not to offer fuch affronts as may call them forth into the field of falle honour, where they cannot acquit themfelves well for want of Ilrength and agility : and they are fecurer from fuch aflronts themfilues, fince others will confider the little credit they will gain by compelling them to appear on that feene. On the whole, tharefore, it may be concluded, that deformity is a protcction to a man's lealth and perfon; which (itrange as it may appear) are better defended by feeblenefs than flrength.
2. 'The infuence of bodiby deformity on a man's fortune may next be confidered. Among the lower clafs, he is cut off from many profffions and employments. He cannot be a foldier, he is under fandard; he cannot be a failor, he wants activity to climb the rigging ; he cannot be a chairman or porter, he wants ftrength to bear the burden. In higher life, he is ill qualilied for a lawyer, he can farce be feen over the bar ; for a divise, he may drop from his hatfock out uf fight in his pulpit. The improment of his mind is his proper province, and his butinefs only fuch as deperds on ingenuity. If he cannot be a dancingmatter to afjuit the liech, he may be a fchoolmatur to 4

## D E F

## Defornity

 Wace; but he may proluce a good pasy : he would appear ill as a lecrald in a procection ; but may pats as a merchant on the excliange: the camut mider for the fatigue of the canpaign ; but he may advite the operations of it : he is dectignod by nature rather to :leep on Parmaflus, than to difcend ha the plains of E.alis: he cannot be crowned at the Olympic gancs; but may be the Pindar to celbtrate them: he can acguite mo glory hy the fword; but he may by the pen, and may grow fanous by cully relating thute exploits whicha are beyond his power to imitate.Lord 13acon (that extenfive and penctratiur genius, who pointed out every part of nature for esanaination), in his Effay on Deformity, fays, "t that in their fuperiors it quenche cha jealloufy towards them, as perfons that they think they may at pleafure defpife ; and it layeth their comptitiors and cinulators affeep, as 1 nc ver believing they flould be in a poflibility of advancennent till the fee them in ponfiction." But it is much to be doubted whether this is not more than counterthalanced by the cuatempt of the world whicla it requires no mean parts to conqure; for if (as has been faid) a good perfon is a letter of reconmendation, deformity mult be an obftruction in the way to favour. In this refpeet, therefore, deformed perforis fet out in the world to a difadrantare ; and they mult firtf furmount the prefindices of mankind before they can be upon a par with others, and mult obtain by a courfe of behaviour that regard which is paid to beanty at frrlt fight. When this point is once gained, the tables are turned, and then the gane goes in their favour: for others, fenfible of their injultice to them, no fooner find them better than they expected, than they believe then better than they are; whereas in the beautiful perfon they fometimes find themfelves impofed upon, and are angry that they have worflipped only a painted idol. For (again take Lord Bacon's words) " neither is it almolt feen, that very beautiful perfons are othervile of great virtue: they prove accomplified, but not of great fpirit; and ftudy rather behaviour than virtue. Whereas deformed perfons, if they be of fpirit, will free themfelves from feon, which mutt be either by yirtue or malice; and therefore let it nut be marvelled if they fometimes prove excellent perfons, as was Agefilaus, Zanger the fon of Soloman, XISop, Gafea prefident of Peru; and Suerates may likewife go amongt them, with others." Nay, he fays, "in a great "it deformity is an advantaze to rifing." And in another part of his works, "that they who by accident have fome inevitable and indelible mark on their perfons or fortures, as deformed people, baftards, se. if they want not virtue, generally prove fortunate."
Otborn, in his Fiflorical Menoirs of Queen Elizabeth, informs us, that " the clofe the goodieft perfons for her houfchoid fervants: but in her counfellors did not put by fuffiency, though aeconnpanied with a crooked perfon; as it chanced in a father and a fon of the Cecils, both incomparable for prudence." It is well known the Queen would make the father
(Burlcigh) fit in her prefence; telling him, that he did Deformity, not ufe him fon his legs, but his head. But the fon (afterwards hord treatimer and Eal of Salibury) was not fo civilly traterd by the populace; and is an in-
 What the hisfort potl eannot retcem at defomed one from contempt: it attendis him like his thadow, and like that too es "ver reminding him of his ill ligure, Whith is often ubjequed for wam of real crimes. For the fame writer fays of the fame great man, "that the inisfortunes aecompanying him from his birth did not a little add to that clond of detraction that fell upors all that he faid or did; a mulet in nature, like an optic fpectacle, multiplying mueh in the fight of the people the apparitions of ill." Nor was this contempt buried with hime: it trampled on his ahes, and infulted his grave; as appars by an epitaph, which Oborn cites, as woid of wit as it is full of fourrility; in one line of which there is an epithet, not fo clegant, as deferiptive of his perfon, viz. " Little Boffive Robin, that was for rreat "

Such contempt in general, joined with the ridicule of the vulgar, is another certain confequence of bodily deformity; for men natmally defpife what appears lefs beantiful or uferul, and their pride is gratified when they fee fuch foils to their own perfons. It is this fenfe of fuperiority which is tettified by laugnter in the lower fort; while their betters, who know how little any man what foever hath to boalt of, are reftrained hy good fenfe and good breeding from fuch an infult. But it is not eafy to fay why one fpecies of deformity fhould be more ridueulous than another, or why the mob fhould be more merry with a crooked man, than with one that is deaf, lame, fquinting, or purblind. It is a back in alto rehicro that bears all the ridicule ; tho' one would think a prominent belly a more reafonable object of it, fince the laft is generally the effect of intemperance and of a man's own creation. Socrates. was ugly, but not contemned; and Philopomen (A) of very nean appearance, and though contemned on that acconnt, not ridieuled: for Montaigne fays, "Ill features are but a luperlicial uglines, and of little certainty in the opinion of men; but a deformity on limbs is more fubtantial, and trikes deeper in." As it is more uncommon, it is more remarkable; and that perlang is the true reafon why it is more ridicuied by the velyar.
3. The laft confideration on this fubject relates to thofe paffions and affections which mot naturally refult from deformity. Lord Baeon obferves, that 'deformed perfons are commonly even with nature; for as wature hath done ill by them, fo do the y by nature, being for the molt part (as the feripture laith) voil of netural aftition." But (fays Mr Hay) "I can neither find out this paffage in feripture, nor the reafon of it; nor can I give my alfent or negative to a propoftion, till I am wtll acguanted with the terms of it. If by natural affection is here mant univerfal benevolence, and deformity neceflaily implies a want of it, a deformed perion mutt then be a complete monfter. Eut howerer
(A) Coming to an inn, where he was expected, beforc his attendants, the mifrefs of the honfe fecing a plain perfon of very mean afpect, ordered him to affit in retting things ready for Philopemen. His attenciants finding him fo cmployed, he told them that he was then gaying the tribute of his ughefs. Fiatoreb,

## D E F

Defurmity. however common the cafe may be, my own fenfations inform me that it is not univerfally true. If by natural affection is meant a partial regard for individuals, I helieve the remark is judicious, and founded in human nature. Deformed perfons are defpifed, ridiculed, and ill-treated by others; are feldom favourites, and commonly moft neglected by parents, guardians, and relations; and therefore, as they are not indebted for much fondnefs, it is no wonder if they repay but little. It is the command of fcripture, Not to fet our affictions on things below; and it is the voice of reafon, not to overvalue what we mult foon part with : therefure, to he fo fond of others as not to be able to bear their abfence, or to furvive them, is neither a religious nor moral duty, but a childifh and womanith weaknefs; and I muft congratulate deformed perfons, who, by example, are early taught another leffor. And I will now lay open my own heart to the reader, that he may judge if Lord Bacon's poftion is verified in me.
"I hope it proceeds not from a malignity of heart; but I never am nuch affected with the common acecidents of life, whether they befall myfelf or others. I am little moved when I hear of death, lofs, or mif. fortune: I think the cafe is common.

$$

And as it is always likely to happen, I am not furprifed when it does. If I fee a perfon ery or beat his brealt on any fuch occafion, I cannot bear him conpany; but am not a Democritus to luach at his folly. Ir read of battles and fields covered with ham; of cities deftroyed by fiword, famine, peltilence, and earthquake; I do not hed a tear: I fuppofe it is, becaufe they are the ufual florms, to which the human fpecies are expofed, proceeding from the juft judgments of God, or the mittaken and falie principles of rulers. I read of perfecutions, tortures, murders, maffiacres; my compaffion for the fufferers are great, but my tears are flopped by refentment and indignation againit the contrivers and perpetratore of fuch horrid ations. Dut there are many things that bring tears into my eyes whether I will or no; and when I reflect, I am often at a lofs in fearehing out the fecret fource from whence they flow. What makes me weep (for weep I do) when I read of virtue or innocence in ditrefs; of a good man helplefs and forfaken, unmoved by the greateft infults and criedties, or courageonly fupporting himfelf againt oppreffon in the article of death? I fuppofe it is, to fee viee triumplant, and virtue fo ill rewarded in this life. May I judge by myfaf, I fould imagine that few fincere Chriltians conid read the fufferings of their Saviour, or Englithmen tho fe of a Canmer, Ridley, or Latimer, without tears; the filt dying to eft ablifi his religion, the lat to refcue it from corruption. When I read of Regulus returning to torment, and John of Frace to imprifonment, aguind the perfuaion of friends, to keep faith with their enemies, I weep to think there is fcarce another iallance of fuch exaled virtue. Thofe who ofeen hear me read, know that my voice changes, and my eyes are full, when I meet with a generons and heroic faying, action, or character, efpeciaily of perfons whof example or command may influence mankind. I weep when I hear a Titus fay, that he had lot the day in which he did no good; when Adrian tells his enemy, that be had efcaped by N 98.

## D E F

his being empernt; or Louis XIII. that he is not to Deforn revenge the affront of the duke of Orleans. Thefe are the firt intances that happen to occur to me: I miglt recollect many, ton many to infert in this effay; yet all are but few, compared to intances of cruelty and revenge: perhaps I am concerned that they are fo rate; perhaps too I inwardly gricve that I ammot in a fituation to do the like. I am entertained, but not moved, when I read Voltaire's Hiftory of Charles XII.; but I melt into tears on reading Hanazy's character of his antagonit Peter the Great. The Girt is a lory of a madman; the other of a father, friend, and bene. factor of his people; where character (as the author obferves in the concluffon of it) will command the admiration of all fucceeding generations; and I fuppore I lament, that God is pleafed to advance to royalty fo few fuch infruments of good to mankind.
Again: "I am uneafy when I lee a log, a horfe, or any other animal ill treated: for I conficer them as endued with quick fenfe, and no contemptible flare of reafon; and that God gave man dominion over them, not to play the tyrant, but to be a good prince, and promote the happines of his fubjects. But I am much more uneafy ar any cruelty to my own fpecies; and heatily with Procruftes difciphined in his own bed, and Phalaris in bis bu'l. A man bruiled all over in a boxing match, or cut to picces in fighting a prize, is a fhocking fpectacle ; and I think I cond wish leis horror fee a thoufand fall in battle, thas human name thes depreciated ard difgraced. Violence, when exerted in wantonnels or paffion, is brutality; and can be termed bravery only when it is fanctioned by juttice and neceffity.
"I have been in arituation to fee not a little of the pomp and vanity, as well as of the necellity and mifery, of mankind : but the laf only affect me; and if, als a magittrate, I an ever guilty of partiality, it is in favour of the poor. When I am at charch anmong my poor but hooed neighbours in the country; and fee them ferions in performing the ceremonies preferibed; tears fometimes theal down my clacek, on reflecting, that they are doing aud hearin many things they do not undertand, while thofe who underfand them hetter neglect them: that they, who labour and live hard, are more thankful to heaven than thofe who fate luxuriouly on the fruits of their labour; and are keepiang and repeating the fourth commandment at the very initant the whes ate breaking it.
"Thefe are fome of the fenfations I feel; which I have freely and fairly difclofed, that the reader may judge, how far I am an inflane of a deformed perfon wanting nazural affe tion. And I am a grood fubject of fpeculation; becaufe all in me is nature : for to own the truth, I lave taken but iittle pains (though I onght to have taken a great deal), to correct my natural detects.
"Loud Dacon's next poffion is, " That deformed perfons are extremely bold: finl in their own defence, as being expofed to cora; but in procefs of time by a general habit.' Thas, probably, is io among the inferiorfort, who are in the way of conitinall infults: for a return of abufe is a matural weanom of folf-defence, and in fome meafure juttific by the of retaliation: To upbraid a man with a perimai biefect, which he cannot help, is alfo an immoral act; and he who does it, las reatoa to expee no beter ynazter than to hear
firmity. of faults, which it was in his own power not to commit. But I find this obfervation far from being verified in myfelf: an unbecoming bafhfulnels has been the confequence of $m y$ ill tigure, and of the worfe management of me in my childhood. I am always uneafy, when any one looks ftedfafly on fo bad a picture; and cannot look with a proper confidence in the face of another. I have ever reproached myfelf with this weaknefs, but am not able to correct it. And it may be a difadvantage to a man in the opinion of thofe he converles with; for though true modelty is amiable, the falle is liable to mifconftruction: and when a man is out of countenance for no reafon, it may be imagined, that he has fome bad reafon for being fo. In point of affurance, I am indeed a perfect riddle to myfelf; for $I$, who feel a reluetance in croffing a drawing room, or in opening my mouth in private company before perfons with whom I am not well acquainted, find little in delivering my fentiments in public, and expoling my difcourfe, often as trifling as my perfon, to the ears of a thonfand. From what caufe this procecds, I know nor: it may he partly from hopes of wiping off any ill impreffions from my perfon by my difcourfe, partly from a fenfe of doing my duty, and partly from a fecurity in public affemblies from any grofs perfonal reffections.
"Lord Bacon compares the cafe of deformed perfons to that of eunuch: ' in whom kings were wont to put great truft as good fpies and whifperers; for they that are envious towards all, are more obnoxious and officious towards one.' But, with fubmiffion to fo good a judge of human nature, I own I can difcover no uncommon qualification in them for fpies; and very few motives to convy peculiar to themfelves. Spies fubmit to that bafe and ungenerous office, either for the fake of intereft or power: if for intereft, it is to gratify their covetoulnefs; if for power, their ambition or revenge; which paflions are not confined to the eunuch or deformed, but indiferiminately feize all claffes of men. Envy too may prompt a man to mean actions, in order to bring down the perfon envied to his own level ; but if it is on account of fuperiority of fortune, it will operate alike on men of all hapes. Eumuchs have but one peculiay motive to envy': but that (as Lord Bacon exprefles it) makes them envious towards all; becaufe it is for a pleafure whici all but themfelves may enjoy. Deformed perfons are deprived only of beauty and ftrength, and therefore thofe alone are to be deemed the extraordinary motives to their envy; for they can no more be beautiful or ftrong than elinuchs be fuccefsful lovers. As to mydelf, whatever fparks of envy might be in mry conftitution, they are now entirely extinguifhed; for, by frequent and ferious refiection, I have long been convinced of the fmall value of noft things which men value the moft.
"There is another paffion to which deformed perVol. V. Part II.
fons feem to be more expoled than to envy ; which is Deformity. jealuufy : for being conlcious that they are lefs amia- ble than others, they may naturally fulpect that they are lefs beloved. I have the happinefs to Ipeak this from conjecture, and not from experience ; for it was my lot, many years ago, to marry a young lady, very piouny educated, and of a very ditinguilhed family. and whofe virtues are an honour to her family and her fex : fo that I had never any trial of my temper, and can only guels at it by emotions I have felt in mg younger days; when ladies have been more liberal of their fniles to thofe whom I thought in every refpect. but perfon, my inferiors."

The moft ueful inference from all this to a deformed perfon is, to be upon his guard againit thofe frailties to which he is more particularly expofed; and to be careful, that the outward frame do not ditort the Coul. Orandum eft (fays Juvenal), ut fit mens faria in corpore fano; "Let us pray for a found mind in a liealthy body :" and every deformed perfon hould add this petition, ut fit neens reffa in corpore curvo, for "an upright mind in a crooked one." And let him frequently apply to himfelf this article of felf-examination, Lenior et melior fis, atcederite fenecta?" As age approaches, do your temper and morals improve?" It is a duty perenliarly incumbent ; for if beauty adds grace to virtue itfelf, vice mult be doubly hidcous in deformity.

Ridicule and contempt are a certain conlequence of deformity; and therefore what a perfon cannut avoid, he thould learn not to regard. He thould bear it like a man; forgive it as a Chrifian ; and confider ir as a philofopher. And his triumph will be complete, if he can exceed others in pleafantry on himfelf. Wit will give over when it fees itfelf outdone; and fo will ma. lice when it finds it has no effect: And if a man's bchaviour afford no caule of contempt, it will fall upon thofe who condemn him without caufe.

Intead of repining, therefore, a deformed perfon ought to be thankful to Providence for giving him fuch a guard to his virtue and repofe. Thoulands are daily ruined by a handfome perfon; for beauty is a flower that every one wants to gather in its bloom, and fpares no pains or flratagem to reach it. All the poctical tories concerning it have their moral. A Helen occafons war and confufion; the Hyacinths and Ganymedes are feized on for Catanaties ; the Endymions and Adonifes for gallants ; Narciffus can admire nobody but himfelf, and grows old before he is cured of that pafion. Who is a Alranger to the Aory of Lucretia killing herfelf for her violated ehaftity? or of Virginia killed by her father to pleferve it? In thofe circumlances, fays Iuvenal, the might with tes change perfons with Kutila; the only lady we know anorig the ancients celebrated for a hurp-back. The handfomelt men are chofen for eunuchs and gallants; and when they are catched in exercifing the laft func. tion, butia (a) Horace and Juvenal inform gon of the $4 \mathrm{X} \quad$ penalics
(A) Hic fe procipitem tecto dedit: ille lagellis Ad morten crelus: fugiens hic decidit acrem Predonum in turbam : dedit hic procorpore nummos: Hunc perminxerunt calones: quinetiam illud

Accidit, ut cuidan teftes caudamque ralacem
Demeterct ferrum _-_Hor. Sat. ii. . . i.
.-..-()uordam mochas et mugilis intrat. Juer. ib pendties and indirnities they undera. Silius ( ${ }^{( }$) was eomerted by the infatiable Mefalina into a hufland ; and Sporus, by the monler Nuro, into a wife. The lat mertioned poet dhows, that prayine for beanty is praying for a curfe; and ( $\curvearrowleft$ ) Perfus refuites to poin in fuch a prayer: And has not the defornced perfou reafon to thank his flars, which have placed him more out of dinger than cren virtue could? for that could not gुuand a Jofeph, an (D) Hippolytus, a Butlerophon, and others, againt the revenge of aighted twe.

Another great advantage of defornity is, that it tends to the improvement of the mind. A man that cannot thine in bis perfon, will have recourfe to his urdertanding; and attonpt to adorn that part of him, whin alone is capable of ornament. When his ambition prompts him to begin, with Cowly, to all himfelf this quation,

\end{aligned}
$$

on looking about him, he will find many avenues to the temple of fane barred againt him; but fome are Hill ofers through that of virtue; and thofe, if lic has a right ambition, he will moll probably attempt to pafs. The more a mao is inactive in his perfon, the more his mind will be at work; and the time which others fpend in daion, he will pafs in ttudy and contemplation: by thefe he may aequire wifdom; and by wifdom, fame. The name of Socrates is as much founded as thofe of Alexander and Cxfar; and is recorded in mueh fairer characters. He gained renown by wifdom and goodnefs; they by granny and oppeffion : he by inftructing, they by deftroying, mankind : and leappy it is, that their evil deeds were confined to thecir lives; white he contianes to infroct us to this day. A deformed perfon will naturally confider where his ftrength and his foible lie: and as he is well acquaiuted with the tall, he will eafiiy find out the firt; ard mult know, that (if it is any where) it is not, like Samfon's, in the hair; but mutt be in the lining of the head. He will fay to himfelf, "I am weak in perfon: unable to ferve my country in the field, I can acquire no military glory; but I may, like Socrates, acquire reputation by wifdom and probity; let me therefore be wife and honefl. My figure is yery bad; and I fhould appear but ill as an orator cither in the pulpit or the bar: let me thercfore pafi my time in my fludy, either in rading what may improve myfelf, or in writing what may entertain or initruct others. I have not the Itrength of Hercules, nor can I rid the world of fo many monlters; but perhaps I may get rid of fome that infer myfelf. If I eannot drav out Cacus from his den, I may pluck the villain from my own breat. I eannot cleanfe the Rable of Augeas: but I may cleanfe my own heart from filth and impurity: I may demolif the hydra of vices
within me; and hould be careful too, that white
I hop of oue, I do not fuffer more to grow up in its llad. Let me be ferviceable in any way that I ean: and if I am in, it my, in fume mafure, be owing to my defomity; which at lealt thould be a reltraint on my conduct, lef my cundas make me more defurmed."

Tew porfons have a houfe entirely to their mind; or the apartments in it dipoled as they could win. And thase is no deformed perfon, who dues not with that his foul had a better habitation; which is fometimes not lodged according to its onvily. Lord Clarendsn fays of Sir Chates Carendifh (brother to the marquis of Newcafle), that he was a man of the mbelt and larget mind, thoush of the leatt and mok inconvenicnt i, dy that lived. Andevery body knows, that the late prince of Orange had mary anmable qualitics. Therriore, in jutiec to foch porfons, we mut fuppofe that they did not refine that their tenements were nut in a more regnar diyle of architecture. And let every deformed peign comfore himfef with reflecting, that though his foul larth mot the mot convenent and beautifulapartment, yet that it is habitable; that the accommodation will ferve as an im upon the road ; that he is bat tevant for life, or (more properly) at will ; and that, while he remains in it, le is in a flate to be envied by the deaf, the dumb, the lame, and the tlind.

DEFOSSION, (DEFOSSio), the pariliment of burying alive, inflited among the Romais on velial virgins guilcy of ineontinency. It is alfo a cultonamong the Hungrians to infite this punihment on women convicted of adultery. Heretics were allo punilhed in this manner. See Burving- Alfure.

Degeneration, on Degenerating, in general, denotes the growing worfe, or loling fome raluable qualities whereof a thing wass formerly poifeffed. Some naturalits have heen of opinion, that things are eapable of degeneratiog into quite a diffinct fpecies; but this is a mere chinera. All that happens in the degeneration of a plant, for inflance, is the lufing its ulual beanty, colour, finell, Ecc. a circumfance entirely owing to ita being planted in an improper foil, climate. ixc.

DEGLUTITION, the action of fwallowing. See Anatome. 10104.

DEGRADATION, in our law-books called difgradation and depofition, the act of depriving or Itripping a fertun for ever of a dignity or degree of honour, and taking away the title, badge, and privileges thereof.

The degradations of a peer, a prief, a knight, a gertleman, an officer, \&e. are pertomed with divers ceremonies. That which aneiently obtained in degrading a perfon from his nobility is very curious. It was practifed in the tinc of Francis I. upon Captain

Degrada- Fangel, who had in a cowardly manner given up Fon$\xrightarrow{\text { tiont. }}$ tarabia, whereof he was governor. On this occafon, 20 or 30 cavatiers, without blemifh or reproach, were allembied; before whom the gentoman was accufed of treafon and breach of faith by a king at arms. 'Two fcafolds were erected; the one for the judges, heralts, and purfuivants; and the other for the guilty cavalicr, who was armed at all prints, and his thietd placed on a take before him, reverfed with the point upwards. On oue fide allitted iz pricts in furplices, who fung the vigils of the deal. At the clofe of each pfalm they made a paufe, during which the officers of arms fti ipped the condemned of fome piece of his armour, heginning with the helmet, and pooceding thus till he was quite difarmed; which done, they broke his fhield in three pieces with a hammer. Then the king at arms emptied a bafon of hot water on the criminal's head; and the judges, putting on mourning habies, went to the church. This done, the degraded was drawn from off the featfold with a rope tied under his ampepits, laid on a bier, aud covered with mortuary clothes; the priefl finging fome of the prayers for the dead ; and then he was delivered to the civil judge and the exceutioner of juttice.

For a more domellic inflance: Sir Andrew Harcla, eanl of Califle, being attainted and consitted of treafon, 18 Edw. II. coram rege; after judgment was pronounced on him, his fword was broken over his head, and his !purs hewn off his heels; Sir Aathony Lacy the judge faying to him, "Andrew, now thon art no knight, but a knave." By tat. 13 Car. II. William Lond Monfon, Sir Heary Mildmay, and others, were degraded from all titles of honour, dignities, and preeminences, and prohibited to bear or ufe the title of lord, knight, elquire, or gentleman, or any coat of arms, for ever fifterwards. It has been maintained that the king may degrade a peer; but it appears from later authorities, that he camot be degraded but by act of parliament.

As to ecelffitics, we have an intance of degradation before condemation to death, in the eighth century, at Conftantinople. It is in the perfon of the patriarch Contantine, whom Conflantine Copronymus canfed to be executed. He was made to afcend the ambo; and the patriarch Nicetas fent fome of lis bifhops to ftrip him of the paliom, and anathematized him : then they made him ro out of the cluach backwards.

Sut we have a much later inflance in our own hifory: When Cranmer, archbifhop of Canterbury, vas degraded by order of Oneen Mary, they didfed him in epifopal robes, make only of canvas, put the mitre on his head and the patural tant in his har of : and in this attire howed him to the people. Waich done, they finped bim again piece by picce. Ae prefent they do not itand fo much on the ceremony of degradation in order to the putting a prielt to death; by seafon of the delays and difficulties that it would occalion. Pope Boniface pronounced that fix bibhops were required to degrade a prist ; but the difficulty of affembling fo many bifops rendered the punthment firquently imptacticable. In England, a prict, afor having been detivered to lis ordinary, if he cannot parge himfelf of the cuime hid at his door, his gown and other tobes ate furipped ore: his cars by the common
hangman; by which he is declared divefted of his or Demphaw ders.

It is decided, however, that degradacion does not efface the prietty characier. Degradation only teems 10 difer from depofition in a few ignominions ceremonies which cultom has and d thereto. Accordingly, in the bufinefs of Arnoul archbilhop of Rheinss, fentenced in the comacil of Orleans in (y) 1 , it was deliberated what form they foould follow in the de poltion; whether that of the canons, that is, fimple depolition: or that of cuftom, viz. degradation. And it was declared, that he thould furrender the vine, palloral llaff, and pallium ; but that his robes fhond not be torn off. In effect, the canons preferibe no more than a mete read. ing of the fentence. It is the reft, therefore, added thereto by cultom, viz. the ftripping off the ornaments and the tearing the pontilical veltnents, that properly conftitutes degradation.

Degradxtion, in painting, expretfes the leffening the appearance of diftint objects in a landfcape, in the fame manner as they would appear to an eye placed at that diflance from them.

DEGREE, in geometry, a divifion of a circle, including a three hundred and fixtieth part of its circumfereace.

## Degree of Latitude. See Latitude. <br> Drgree of Longifule. See Longitude.

A degree of the meridian on the furface of the glowe is varioully determined by various oblervers. Mr Picart meafured a degree in the laticude of $49^{\circ} 21^{\prime}$, and found it equal to 57060 Prench toifes. But the French mathematicians, who have lately examined Mr Picart's operations, affure us, that the degree in that latitude i. 57183 toifes. Our countryman, Mr Norwood, meaEured the diftance between London and York, and found it 005751 Englifo feet; and finding the diference of latitudes $2^{\circ} 23^{\prime}$, determined the quantity of one degree to be 3671 gh Englifh feet, or 69 Englim miles and 288 yaros. Mr Maupernuis meafured a degree in lapland, in the laritude of $66^{\circ} 20^{\prime}$, and found it $57+38$ toifes. A degree was likewife mealured at the equator by other French mathematicians, and found to contain 56767.8 toifce. Whence it appears, that the earth is nut a fphere, but an oblate fpheroid.

Degree, in the civil and canon law, denotes an interval in kinflip, by which proximity and remotenefs of blood are computed. See Consanguinity and Descent.

Degrees, in mufic, are the litcle intervals whereof the concords or hirmonical intervals are compofed.

Degree, in univerfities, denoies a qualit) conferred on the thadents or memhers thereof, as a teltimony of their proficicacy in the arts of feiences, and inticling them to cerata privikges.

DEJANIRA, in fibubus hidorr, daughter or Oeneus king of Retolia, and wietu Mercule. The centaur Vellius endeavouring to rarith hem, was ilain ly Hercules with a poifned arrow. Nellus, whem lis: ing, gave his bloody lairt to Dejanira; atheng ber,
 ever he pooved unfathfut. Some time ator, D jon: a thinking the had reafon to fufpect his filelity, font has the ihart ; which he lad no fooncr pat on, than he was feized with the molt excruciatiog tuments. B:ing unable to fupport hispains, herebind to mornt $4 \mathrm{X}=\mathrm{Octa}_{2}$

DEJECTION, in medicine, the act of voiding the excrements by the anus. See Anatomy, ${ }^{\circ} 93$.
deification, in antiquity. See Apotheosis.
DEIPHON, in fabulous hiftory, a brother of Triptolemus fon of Celeus and Metanira. When Ceres travelled over the world, fhe ftopped at his father's court and undertook to nurfe him and bring him up. To reward the holpitality of Celeus, the goddefs began to make his fon immortal, and every evening fhe placed him on burning coals to purify him from whatever mortel particles he fill poffefed. The unconmon growth of Deiphon afonifhed Metanira, who wifhed to fee what Ceres did to make him fo vigorous. She was frightened to fee her fon on burning coals; and the mricks that the uttered difurbed the myterious operations of the goddefs, and Deiphon perifthed in the flames.

DEISCAL, in the ancient Britifh culfoms, the name of a cerenony originally ufed in the druidical worfhip, and retained in many places down to a very late period as a civil ceremony towards perfons of particular diftinction. The temples of the ancient Biitons were all eircular ; and the druids, in performing the public offices of their religion, never neglected to make three turns round the altar, accompanied by all the worlhippers. This practice was fo habitual to the ancient Britons, that it continutd in fome places many ages after the druids and their religion were both defroyed. In the Scottifh ifles, the vulgar never come to the ancient facrificing and fire-hallowing eairns, but they walk three times round them, from eaft to wefl, according to the courfe of the fun. This fanctified tour, or round by the fouth, is called deifcal, from cleas or defs, "the right-hand," and foil or ful, "the fun;" the right-hand being ever next the heap or cairn. In the fame ifles it is the cultom and fafhion of the people to teftify their refpect for their chieftains, rhe proprietors of their Ceveral ifles, and other perfons of diftinction, by performing the deifcal round them in the fame manner. A gentleman giving an account of his reeeption in one of the weflern iflands, of which he was proprietor, deferibes the ceremony of the deifcal in this manner: "One of the natives would needs exprefs his high eiteem for my perfon, by making a turn round about me fun-ways, and at the fame time bleffing me, and wifhing me all happinefs. But I bid him let alone that piece of homage, telling him I was fenfible of his good meaning towards me. But this poor man was very much difappointed, as were alio his neighbous; for they doubted not but this ancient ceremony would have been very aceeptable to me ; and one of them told me that this was a thing due to my character from them, as to their chief and patron; and that they could not, and would not, fail to perform it "

DEISM, the doctrine or belief of the deilfs. Deiim, from :os. God, may properly be wfed to denote natural religion, as comprehending thofe truths which have a real fontudation in reafon and nature; and in this fenfe it is fo far from being oppolite to Chriftianity, that it is one great defign of the gofpel to illu-
ftrate and enforce it. Thus fome of the deiftical writers have alfected to ufe it. But deifim more precifely fignifies that fyltem of religion, relating both to doctrine and practice, which every man is to difcover for himfelf by the mere force of natural reafon, independent of all revelation, and exclufive of it ; and this religion Dr Tindal and others pretend is fo perfeet, as to be incapable of receiving any addition or improvement even from divine revelation.

DEISTS, a clafs of people, known alfo under the denomination of Free-thinkers, whofe diftinguihing character it is, not to profefs any particular form or fyftem of religion; but only to acknowledge the exiftence of a God, and to follow the light and law of nature, rejeeting revelation, and oppofing Chriltianity.

This name feems to have been firft aflumed as the denomination of a party about the middle of the 16 th century, by fome gentlemen in France and Italy, who were defirous of thus difguifing their oppofition to Chritianity by a more honourable appellation than that of atheifts. Viret, an eminent reformer, mentions certain perfons in his epiftle dedieatory prefixed to the fecond tome of his Inftrusion Cbretienne, publithed in $15 \sigma_{3}$, who called themfelves by a new name, that of $D i j / s$. Thefe, he tells us, profeffed to believe in God, but fhowed no regard to Jefus Chrift, and confidered the doetrine of the apofles and evangelifts as fables and dreams. He adds, that they laughed at all religion, though they outwardly conformed to the religion of thofe with whom they lived, or whom they wifhed to pleale, or feared to offend. Some, he ob. ferves, profuffed to believe the immortality of the foul; others denied both this doetrine and that of providence. Many of them were confidered as perfons of acute and fubtil genius, and took pains in diffeminating their notions.

The deifts hold, that, confidering the multiplicity of religions, the numerous pretences to revelation, and the precarious arguments generally advaneed in proof thereof, the beft and fureft way is to return to the fimplicity of nature and the belief of one God; which is the only truth agreed to by all nations. They complain, that the freedom of thinking and reafoning is oppreffed under the yoke of religion; and that the minds of men are ridden and tyrannized by the neeeffity impofed on then of believing inconceivable myfleries; and contend that nothing flould be required to be affented to or believed but what their reafon clearly conceives.

The diftinguifhing character of modern deifs is, that they reject all revealed religion, and difcard all pretences to it as the effects of impolture or enthufiafm. They profefs a regard for natural religion, though they are far from being agreed in their notions concerning it. They are clafted by fome of their own writers into mortal and immortal deifts : the latter acknowledg. ing a future flate; and the former denying it, or reprefenting it as very uneertain.

Dr Clarke diftinguifhes four forts of deifs. 1.Thofe who pretend to believe the exiftence of an eternal, in. finite, independent, intelligent Being, who made the world, without concerning hinfflf in the govenment of it. 2. Thofe who believe the being and natural
providence

## D E I［717］D E L

Deils．providence of God，but deny the difference of actions as morally good or evil，refolving it into the arbitrary conflitution of human laws；and therefore they fup－ pofe that God takes no notice of them．With refpect to both thefe claffes，he obferves that their opinions can confillenty terminate in nothing but downight atheifm．3．Thofe who having rigit apprehenfions concerning the nature，attributes，and all－governing providence of God，feem alfo to have fome notion of his moral perfcctions；though they confider them as tranfendent，and fuch in nature and degree，that we can form no true judgment，nor argue with any cer－ tainty concerning them：but they deny the immorta－ lity of human fouls；alceging that men perith at death， and that the prefent life is the whole of human exit－ ence．4．Thole who believe the exitence，perfections， and providence of God，the obligations of natural re－ ligion，and a fate of future recribution，on the evi－ dence of the light of nature，without a divine revelis－ tion：fuch as thele，he fayc，are the only true deifts； but their principles，he apprehemds，fhould lead them to embrace Chrittianity；and therefore he conchudes that there is now no conliftent feheme of deifm in the world．
＊The firf deiftical writer of any note that appeared in this country was Herbert baron of Cherbury．He lived and wrote in the lall century．His book $D_{e} V_{e}$ ． ritate was firt publithed at Paris in 1624．This，to－ gether with his book De Caufis Errorum，and his trea－ tife $D e$ Religione Laicic，were afterwards publifhed in London．His celbbated work De Religiome Gcatilizm －was publifhed at Amfterdam in 1663 in 4 to，and in 1700 in 8vo，and au Englith tranflation of it was pub－ lithed at Lomton in 1705 ．As he was one of the firft that formed deifin into al lytem，and affierted the fuf－ fieiency，univerfality，and abfolute perfection，of na－ tural religion，with a view to difcard all extrandinary revelation as ufetefs and needlefs，we fhall fubj in the five fundanental articles of this univerfal religion． They are thefe：1．That there is one fupreme God． 2．That he is chiefy to be womhipped．3．That piety and virtue are the principal part of his worfhip． 4. ＇That we mult repent of our fins；and if we do fo， God will pardon them．5．That there are rewards for good men and punifments for bad men，both here and lereafter．Our own age has produced a number of advocates in the fame caufe；and however they may have differed among themfelves，they have been agreed in their attempts of invalidating the evidence and authority of divine revelation．We might men－ tion Hobbes，Blount，Toland，Collins，Woolitun，Tin－ dal，Morgan，Chubb，Lord Lolingbroke，Hume，\＆c． Some have allo added Lord Shaftefoury to the num－

## ber．

But the friends of Chritlianity have no reafon to re－ gret the free and uncferved difulfion which their re－ Iggion has undergone．Objections have been Itated and urged in thrir full force，and as fully anfivered； argument and raillery have been repliced；and the controverfy between Chriltians and drifts has called forth a great number of excellont writers，who have illu＇trated buth the doctrines and evidence of Citriti－ anity in a manner that will ter reflect honour on their names，and be of lalting fervice to the cane of genu－ ine religion and the beft interctio of manking．

DEITY，Godkead；a common appeliation given to Deiey， God；and alfo by the poets to the heathen gods and Delaware． goddeffes．

DELAWARE，a province of North America，fi－ tuated on a river of the fame name．

The Dutch，under the pretended purehale made by Henry Hudfon，took poitition of the lands on both fides the river Delaware；and as early as the year 1623 built a fort at 17 ．place which has fince been called Glowefer．In 1627 ，by the influenee of Withian UCeling，a refuciable merchant in Sweden，a colony of Swides and Fimus came ovel，furnihed with all the necefarics for begimingr a new fettlement，and dad－ ed at Cape Henlupen ；at which time the Dutch had wholly quited the country．The I utch，however， retmoned in 1030 ，and built a fort at Lewillown，by them named Hoarkill．The year following the Swede＇s built a fore near Wilmington，which they cadied Chri／－ tion or Cherifiume．Here alfo they laid ont a fmal！ town，which was afterwards demolifhed by the Dutch． The fame jear they enceted a fort higher up the ni－ ver，upon＇Penccum illand，which they called Now Gotcubargh；they alfo about the fame time built forts at Chefter，Elfinburgh，and other places．John Prinz then governed the Swedes，who，in $165+$ ，deputed his fon－in－law，John Papgoia，and returned to Sweden． Papgoia foon followed his father－in－law to his native countiy，and John Ryfing fucceeded to the govern－ ment．In 1655 ，the Dutch under the command of Peter Stuyvclant，arrived in Delaware river，from New Amfterdam（New York），in feven veffels，with 6 or 700 men．They difpoffefled the Swedes of their forts on the river，and carried the officers and princi－ pal inhabitants prifoners to New Amfterdam，and from thence to Holland．The common people fubmitted to the conquerors and remained in the country．On the firtt of Oetober $166_{4}$ Sir Robert Carr obtained the fubmilfion of the Swedes on Delaware river．Four years after，Col．Nicolls，governor of New York，with his council，on the 21！t of April，appointed a foont and five other perfons to affit Capt．Carr in the go－ vernment of the country．In 1672 ，the town of New－ caftle was incorporated by the government of New York，to be governed by a bailiff and lix afillants； after the firt year，the four oldeft were to leave their offre and four others to be chofen．The bailifl was prefulent，with a double vote；the conftable was cho－ fen by the bench．They had power to try caufes not exceeding L．10，without appeal．The offec of foout was converted snto that of fheriff，who had jurifdic－ tion in the corporation and along the river，and was annually chofen．They were to have a free trade， withont being obliged to make entry at New York， as had formerly been the prackice．Wampum was at this time the principal currency of the country．Cio－ vemor Lovelace of New York，by proclimation，or－ deted that four white gratis and three black ones fhould pafs for the value of a lliver ar perny．This proclamation was publihed at Albany，Efoynts，De－ laware，Long lfland，and the parts adjacent．In 674 ， Chates EI．by a fecond patent，dated fune 2 oth，gramted to his brother duke of York all that comntry called li the Dutch New Netherlateds，of which the threc cout i－ ties of Newcalle，Kent，and Suffex were a part．lis sús 3，the duke of Jurk，b＂deed dated Angult $2+1$ ：

Dtaware. Suld to William Penn the town of Newcafle, with the -. diftrict of 12 miles round the fame; and by anotier deed of the fame date, granted to him the remainder of the territery, which, till the revolution, was called the Thas Loser Commes. Thefe three counties were confidered as a part of Penn!lvania in matters of govermment. The fame governor ; refided over both: but the affembly and courts of judicature were diferent; different as to their conllitu." members, but in form nealy the fame. At the late revolution they became a diflinct terriory, called

The Delawere Sate. This Rate is hounded on the north by the territoriad line which divides it from Benmflvania; on the eall, by Delaware river and Bay; en the fonth, by a due ean and well hine, from Cape Ifenlopen, in lat. $3^{8}$. 30 to the middle of the perinfala ; and on the wall by Maryland. The climate is in many parts untealthy. The land is gencratly low and flat, which oceations the waters to llagnate, and the confecuence is, the inhabitants are fubject to intermittents.

The Diaware thate is divided into three countice, siz. Newcatle, Fent, and Suffex; the chiff town of which are, Vihnington and Newcalle, Dover, Milford, and Lematon.

Three rivers, the Choptank, Nanticok, and Pocomoke, have their funces in this thate, and are navigable for veffels of 50 or 60 tuns, 20 or 30 miles into the country. They all run a wetwardly courfe into Chefapeak Bay. The funth part of the thate is a low flat country, and a confliderable potion of it lies in forett. What is under cultivation is chithy baren, except in Indian corn, of which it produccs tige crops. Th fome places ree and tha my be raiied, but wheat is a forcignce in thefe parts. Where nature is deficient in one refonce, the is enencrally bountiful in another. This is verified in the tal! thick foreths of pines which are manufactured into buads, and eaported in large quantities into crory fa-port in the three adjoining Intes.-As you proced anthe the foil is more fertile, and produces wheat in large guantities, which is the thaple commodity of the flate. They raife all the othei kinds of grain common to Pennfyvania. The thate has no mumtain in it, except Thunder Hill, in the weftum pait of Newcatle county, and is generalby level, except fome fmall parts, which are lony and uneven. The tade of this tate, which is inconfideralle, is carried on principally with Philadelphia, in boats and thallops. The articles exported are principally what, com, lumber, and hay.

Where are, in this thate, za Prelbyterian congregations, belongiag to the fy nod of Pliladulhia; feren Epifoonl charches: fix congregations of Paptits, containg about 218 fouls; four congregations of the people called Qutiors; betides a Swedith charch at Vimmington, which is one of the oldett churches in the [ated Statur, and a number of Muthodills. All thele denomimations have free tulcration by the confitution, and live tugather in harmony.

In the convention hid at Philadelphia, in the fummer of 185. , the inhalitants of $D$ daware were reckoned at 37,000 , which is about 26 for every fquare mile. There is nu obvious charachuritical difference between the inhabitants of this llate and les Pennfy laniars. Sue Pennstliania.

## D E I.

Under the prefent conftitution, the leginature is Delaware. divided into two diltinct branches, which together are Ayled The General dfombly of Delazuare. One branch, called the Houfe of dyembly, coniilts of feven reprefentatives from each of the three counties, chofen annually by the frecholders. The other branch, called the Cometil, ennfits of nine members, tliree for a county, who mult be more than 25 years of age, chofen likewife by the freeholders. A rotation of members is eflablifhed by difplacing one member for a county at the end of every year. All money bills muil originate in the houle of affembly, but they may be altered, amended, or reiceted, by the legillative conncil. A prefident or chief magittrate is chofen by the joint ballot of both houfes, and continues in office three years: at the expiration of which period, he is incligible the three fucceeding years. If his office becomes racant during the receds of the legilature, or he is unable to attend to butinefs, the feaker of the legiflative council is vice-pretilant for the time; and in his abfence, the powers of the prefident devolve upon the feaker of the allimbly. A priny council, confiling of four members, two from each houfe, chofen hy ballut, is comfituted to allit the clicf magiflrate in the admsn:fration of the government. The three juflices of the fupreme court, a fudge of admiralty, and four jutices of the conmon pleas and orplians counts, are appointed by the joint ballot of the prefident and general aftembly, and commifioned by the prefident to hold their offices during good belaviour. The prethdent and privy council appoint the fecretary, the attomey general, regilers for the probate of wills, regiHers in chancery, clerks of the common pleas, and orplans courts, and the clerks of the peace, who hold their offices during five years, undefs fooner removed for mal-couduct. The houfe of affembly name 24 perfons in each county for juRices of peace, from whach number the profident, with the advice of his comacil, appoints and commifions twelve, who ferve for leven years, unlefs fooner difmiffed for mal-adminill ration. The members of the legilative and privy councils are juutices of the peace for the whule flate.-The courts of common pleas and orplans courts have power to hold chancery courts in certain cafes. The clerk of the fupreme court is appointed by the chief jutice, and the recorders of deeds, by the julaices of the common pleas, for hive years, mblefs fuoncr difinifed. All the military and marine oflicers are appointed by the georal affembly. The court of appeals confits of leven perlions: the prelident, who is a member, and prefides by virtue of his office, and hix whers, three to he chofen ioy the legifative counch and three by the houfe of atimbly. To this conrt appeals lie fiom the fupren c court, in all matters of law and equity. The judges hoold their ufice during good betaviour.

The jullices of the feveral courts, the members of the privy council, fecretary, trathees of the loan office, clurks of the conmon pleas, and all perfons concerned in arny or nayy contracts, are inctigible to either houle of allembly. Eveny member, before taking lis feat. mult take the oath of allogiance, and futfcribe a religrious tet, declaring his belicf in God the Father, in Jefus Chith, and the Foly Chott; and in the infpiration of the Scriptures.

Deife. -nwith colours compofed of metallic calces, mixed and ground with a fufible glafs. When they are become perfectly dry, they are to be placed in the furnace, included in cafes of baked earth called feggars, and cxpofed to a hcat capable of fufing uniformly the enamel which covers them.-This heat given to fufe the enamel being much flronger than that whieh was applied at firt to give fome confifence to the ware, is alfo the heat neceffary to complete the baking of it. The furnace and the colours ufed for painting this ware, are the fame as thofe employed for Porcelain. The glazing, which is nothing but white enanel, ought to be fo opaque as not to fhow the ware under it. There are many receipts for making thefe enamels: but all of them are compofed of fand or flints, vitrifying falts,
Stion. Die. calx of lead, and cals of tin ; and the fand muft be perfectly vitrified, fo as to form a glafs confiderably fufible. Somewhat lefo than an equal part of alkaline falt, or twice its weight of cals of lead, is requifite to effect fuch vitrifications of fand. The calx of tin is not intended to be vitrified, but to give a white opaque colour to the mads; and one part of it is to be added to three or four parts of all the other ingredients taken together. From thefe general principles, various enamels may be made to fuit the different kinds of earths. To make the enamel, lead and tin are calcined together with a ftrong fire; and the fand is alfo to be made into a fritt with the falts or aftes. The whole is then to be well mixed and ground together. This matter is then to be placed under the furnace, where it is melted and vitrified during the baking of the ware. It is next to be ground in a mill, and applied as above directed.

The preparation of the white enamel is a very effential article in making delft-ware, and one in which many artifts fail. M. Bofc. d'Antic, in a Memuir concerning this kind of ware, publifhed in the Mem. des Scavans Etrang. tom. 6. recommends the following proportions. An hundred pounds of calx of lead are to be mixed with about a feventh part of that quantity of calx of tin for common delft-ware, or a fourth part of calk of tin for the finett kind; an lundred, or an hundred and ten, pounds of fine fand; and about twenty or thirty pounds of fea falt- - Concerning the earth of which the ware is made, he obferves, that pure clay is not a proper material when ufed alone. Different kinds of earths mixed together are found to fucceed better. Pieces of ware made of clay alone, are found to require too much time to dry; and they crack, and lofe their form, unlefs they are made exceedingly thick. An addition of marle diminithes the contraction of the cldy ; renders it lefs compats ; and allows the water to efeape, without altering the form of the ware in drying. It affords alfo a better ground for the enamel: which appears more glofly and white than when laid on clay alone. - The kinds of clay which are chiefly wed in the compofition of delt-ware, are the blue and grecn. A mixture of blue clay and marle would not be fufficiently folid, and would be apt to feale, unlefs it were expoied to a fire more intenfe than what is commonly ufed for the burning of delftware. To give a greater foldity, fome red clay is added; which, on account of its ferruginons matter, poffefes the requilite biading quality. The proportions of thefe ingredients, as in diferent works, according to the dif$\therefore 0.3$
ferent qualities of the earths employed. Three parts of blue clay, two parts of red clay, and five parts of marle, form the compofition ufed in feveral manufactories. M. d'Antic thinks, that the beft deift-w'are might be made of equal parts of pure clay and pure calcareons earth ; but this compofition would require that the fire fhould be continued twice as long as it generally is.

DELIA, in antiquity, a feltival celebrated every fifth year in the inland of Delos, in honour of Apollo. It was firf inflituted by Thefens, who at his return from Crete placed a ftatue there, which he had received from Ariadne. At the celebration they crowned the ftatue of the goddefs with garlands, appointed a choir of mufic, and exhibited horfe-races. They afterwards led a dance, in which they imitated by their motions the various windings of the Crctan labyrinth, from which Thefeus had extricated himfelf by Ariadne's affitance.-There was another feftival of the fame name yearly celebrated by the Athenians in Delos. It alfo was inflituted by Thefeus, who, when he was going to Crete, made a vow, that if he returned victorious he would yearly vifit in a folemn manner the temple of Delos. The perfons employed in this annual proceffion were called Definfte and Thcori. The fhip, the fame which carried Thefeus, and had been carefully preferved by the Athenians, was called Theo. ria and Delias. When the fhip was ready for the voyage, the priclt of Apollo folemnly adorned the ftern with garlands, and an univerfal luftration was made all over the city. The Theori were crowned with laurels, and before them proceeded men armed with axes, in commemorat:on of Thefens, who had cleared the way from Treezen to Athens, and delivered the country from robbers. When the fhip arrived at Delos. they offered folemn facrifices to the god of the illand, and celebrated a feftival to his honour. After this they retired to their fhip and failed back to Athens, where all the people of the city ran in crowds to meet them. Every appearance of fettivity prevailed at their approach, and the citizens opened their doors and proftrated themfelves before the Deliafte as they walked in proceffion. During this feitival it was unlawful to put to death any malefactor, and on that account the life of Soerates was prolonged for thirty days.

Delia, a furname of Diand, becaufe the was born in Delos.

DELiAC, Dellacus, amoug the ancients, denoted a poultercr, or a perfon who fold fowls, fatted capons, \&c. The traders in this way were called Deliaci : the people of the ine of Delos firlt practifed this occupation. They alfo fold eggs, as appears from Cicern, in his Academic Quettions, lib. iv. Pliny, hib. x. cap. 30. and Columella, lib. viii. cap. 8. likewife mention the Deliust.

DELIBAMENTA, in antiquity, a libation to the infernal gods, always offered by pouring downwards. See Libation,

Jus DELIBERANDI. See Law, No chax. 23.
DELIBERATIVE, an appellation given to a kind or brancl of rhetoric, employed in proving a thing, or convincing an affembly thereof, in order to perfuade them to put it in execution.

To have a deliberatite woice in the affembly, is when a perfon lias a right to give his advice and his

## D E L [ 72 I$] \quad$ D E L

Ledia vote thercin. In councils, the bihops have delibera- $t$ ) the external objects, but are produced by the change tive roices; thofe beneath them have only confultative

DELICT, in Scots hw, figraiics fuch fmall offences or breaches of the peace as are punithable only by fine or fhort imprifonment.

DELIMA, in botany: A genus of the monogynia order, belonging to the polyandia clafe of plants : and in the natural methorl ranking with thofe of which the order is doubtful. There is no corolla; the calyx is five-leaved, with a two-feeded berry.

DELINQUENT, a guilty perfon, or one who has committed fome fault or offence for which he is punifhable. See Britain, $n^{\circ} 97$.

DELIOUESCENCE, in chemilary, foruifies the property which certain bodics have of attracting moifture from the air, and becoming liquid thereby. This property is never found but in faline fublances, or natters containing them. It is caufed by the great afinity which chefe fubfances have with water. 'The more fimple they arc, aceording to Mr Macquer, the more they incline todeliquefence. Hence, acids, and certain alkalies, which are the mof fimple, are alfo the moft deliquefeent falts. Mineral acids are fo deliquefcent, that they ftrongly imbibe moifure from the air, even though they are alrady mixed with a fufficient quantity of water to be fluid. For this purpole, it is fufficient that they be concentrated only to a certain degree.-Man neutral falts are deliquefeent, chicfly thofe whofe bafes are not faline fubtlances. Salts formed by the vitriolic acid, with fixed or volatile alkaties, earths, or molt metallic fubfances, are not deliquefeent; although this acid is the thronget of all, and, when difengared, attracts the moilture of the air moft powerfully.
'lhough the immediate caufe of deliquefcence is the attraction of the moilure of the air, as we have already obferved: yet it remains to be fhown why fome falts attrakt this moiture powerfully, and others, though feemincly equally fimple, do not attract it at all. The vegetable alkali, for inftance, attracts moilture powerfully; the mineral alkali, though to appearance equally imple, does not attract it at all. The acid of tartar by itfelf does not attract the moilture of the air; but if mixed with borax, which has a little attraction for moitture, the misture is exceedingly deliquefcent. Some theories have been fuggelled, in order to account for thefe and other fimilar facts; but we are as yet too bittle acquainted with the nature of the atmofphere, and the relation its conftuent parts have to thofe of cerreftrial fubfances, to determine any thing with certainty on this lead.

DEIJQUIUM, or Derioverk Animi from difinquo, "I fwoon"), a fwoming or fainting awny; called alfo fyncope, lipoillymia, lepoofychia, ectulis, and afshyxia.

Deliquium (from deliquefio, "to be diffolved"), in chemillry, is the diffolution or melting of a falt or calx by furpending it in a moift cellar.

Salt of tartar, or any fixed alkali, fet in a cellar or other cool moift place, and in an open veffel, refolves or runs into a kind of liquor called by the chemifts oil of tartar per deliquium.

DELIRIUM (from deliro, " to rave or talk idly"). When the ideas excited in the mind do not correfpond Vol. V. Part II.
induced on the common fewfory, the patient is faid to be delirious. See Medicive-Imder.

DELIVERY, or Chald-birtu. Sec Minwifery. DELLLI, or DELHI, a kingdont and cioy of the Mogul's empire, in Alia. The city is one of the capitals of the empire. The road butween it and Agra, the other capital, is that farmous alley or walk planted with trees by Jehin Ghir, and 150 leagues in length. Each half league is marked with a kind of turret; and at every fage there are little farays or caravanferas for the benelit of traveliers. The road, though pretey good, has many inconveniences. It is not on!y frequented by wild beats, but by robbers. 'The later are fo dexterous at catting a noofe about a man's neck, that ther nevor fail, if within reach, to feize and trangle him. They gain their point likewife by means of handiome women; who, feigning great diferefs, and being taken up behind the unwary traveller, choak bim with the fame fuare.- Che capital confitts of three cities, built near one another. 'The lirit, now quite deftroyed, is hid to have had 52 gates: and to have been the refidenee of king lorus, conquered by Alexander the Great. The fecond, which is alto in ruins, was demolifhed by Shah Jchan, to build Gehom-alad with the materials. This makes the third city, and joins the ruins of the fecond. This city tands in an open phain country, on the river Gamut, which rifes in this province. It is encompafled with walls, except towards the river. Thefe are of brick, flanked with rome towers; but without a ditch, and terraced behind, four or five fect thick. The circumference of the walls may be about nine miles. The foctrefs, which is a mile and an half in circuit, has good walls and round tuwers, and ditches full of water, faced with ftome. It is furrounded with fine gardens, and in it is the Mogul's palace. See Indos ran. E. Long. 79.25. N. Lat. 2 R. 20.

DELAMENHORST, a ftrong town of Germany, in the circle of Weftphalia, and comenty of Oldenburgh, belonging to Denmark; feated on the river Dehm near the Wefer. E. Long. 8.37. N. Lat. 53. 10.

DELOS, an ifland of the strhipelago, very famous in ancient hiltory. Originally it is faid to have been a floating ifland, but afterwards it became fixed and immoveable. It was held facred on accuunt of its being the birth-place of Apollo and Diana. - Anciently this ifland was governed by its own kings. Virgil mentions one Antus reigning here in the time of the Trojan war. He was, according to that poet, both king and high-prieft of Apollo, and entertained Encas with great kindnefs. The Perfians allowed the Dehans to cnjoy theirancient liberties, after they had reduced the rett of the Grecian iflands. In after agres, the Athenians made thenfelves maters of it ; and heli it till they were driven out by Mithridates the Great, who phandered the rich temple of Apollo, and obliged the Delians to fide with him. Mithridates was in his turn driven out by the Romans, who granted the inhabitants many privileges, and exenpted them from all fonts of taxes. At prefent it is quite abandoned; the lands being covered with ruirs and rubbifh, in fuch a manner as to be quite incapable of cultivation. The inhabitants of Mycone lold it now, and pay but ter crowns land-tax to the Grand Signior for an illand 4 X which

Duns. which was once one of the richelt in the world. - Strabo and Callimachas tell us that the illand of Delos was watered by the river Inapus: but Pliny calls it only a fring ; and auds, that its waters fwelled and abated at the fame tinue with thofe of the Nile. At prefent there is no river in the ifland, but one of the noblet frings in the world ; being twelve paces in diameter, and inelsed partly by rocks and partly by a wall. Mount Cynthus, whence Apollo had the furnarne of Cynthius, is by Strabo placed near the city, and faid to be fo high, that the whole illand was covered by its thadow; but our modern travellers fpeak of it as an hill of a very moderate height. It is but one bloek of granate of the ordinary fort, cut on that tide which faced the city into regular fleps, and inclofed on both fides by a wall. On the top of the mountain ane flill to be feen the remains of a ttately building, with a mofaic pavement, many broken pillars, and other valuable monuments of antiquity. From an infeription difcovered there fome time ago, and which mentions a row made to Serapis, Ifis, and Anubis, fome lave conjectured, that on this hill tood a temple dedicated to thefe Egyptian deities, though no where mentioned in hillory.-The city of Delos, as is manifelt from the magnificent ruins lill extant, took up that facious plain reaching from one coalt to the otner. It was well peopled, and the richelt eity in the Arehipelago, efpecially after the defruction of Corinth; merchants flocking thither from all parts, both in regard of the immmity they enjoyed there, and of the convenient fituation of the place between Europe and Afia. Strabu calls it one of the muit freguented empories in the world ; and Piny tells us, that all the commodities of Furope and Afia were fold, purchaled, or exchanged, there. It contained many noble and fately buiddiags; as, the temples of Apollo, Diana, and Latona; the porticoes of Philip of Macedon, and Dionytine Eutyches; a gymnafium; an oval bafon made at an immeate expenfe, for the reprefentation of lea-fights; and a moll magnincent theatre. The temple of Apollo was, according to Plutarch, begran by Eryfichon the fon of Cecrops; but afterwards enlarged and embellithed at the common charres of all the llates of Grecee. Plutarch tells us, that it was one of the moft ftately buildings in the miverfe; and fpeaks of an altar in it, which, in his opinion, deferved a place among the wonders of the world. It was built with the horns of various animals, fo artificially adapted to one another, that they hanged together without any coment. This star is faid to have been a perfect cube; and the doutling it was a famons mathematical problem among the ancients. This went under the name of Problema 1).finum; and is faid to have been propofed by the oracle, for the purpufe of freeing the comery from a fiague. The diftemper was to ceafe when the probiem was folved. - The tronk of the famons fatue of Apollo, metioned by Strabo and Pliny, is itill an obwot of great admiration to travellers. It is without sead, feet, arms, or legs; but from the parts that are yet remaining, it plainly appears, that the ancients did sot exaggerate when they commended it as a wonder of art. It was of a gigantic lize, though cut out of a fingle block of marble; the fhoulders being fix feet lroad, and the thighs nine feet round. At a fmall difance from this thatue lies, amongt confufed heaps
of broken columns, architraves, bafes, chapiters, Exc. a Cquare piece of marble $15^{\text {r }}$ feet long, ten feet nine inches broad, and two feet three inches thick; whieh undoubtedly ferved as a pedettal for this colollis. It bears in very fair characters this infeription in Greek, "The Naxians to Apollo." Plutareh tells us, in the life of Nieias, that he caufed to be fet up, near the temple of Delos, an huge palm-tree of brafs, which he confecrated to Apullo; and adds, that a violent Itorm of wind threw down this tree on a colofian flatue raifed by the inhabitants of Naxos. Round the temple were magnificent porticoes built at the charge of various princes, as appears from inferiptions which are kill very plain. 'The names of Philip king of Macedon, Dicurylius Eutyches, Mithridates Eucrgetes, Mithridates Eupator, kinge of Pontus, and Nicomedes king of Bithynia, are found on feveral pedeitals. - To this temple the inhabitants of the neighbouring illands fent yuarly a company of virgins to celcbrate, with dancing, the fellival of Apollo and his litter Diana, and to make offerings in the name of their refpective cities.

So very facred was the illand of Delus held by the ancients, that no holtilities were practifed here, even by the nations that were at war with one another, when they happened to meet in this place. Of this Livy gives an inftance. He tells us, that fome Roman deputies being obliged to put in at Dtus, in their voyage to Syria and Egypt, found the galleys of Perfeus king of Macedon, and thofe of Eumenes king of Pergamus, anchored in the fame habour, though thete two princes were then making war upon one another. - Hence this indand was a general afylum, and the protection extended to all kinds of living creatures; for this reafon it abounded with hares, no dugs being fuffered to enter it. No dead body was fuffered to be buriech in it, nor was any woman fufferes to lie-in there; all dying perfuns, and wonen ready to be delivered, were carried uver to the neighbouring ifhand of Rhene:.

DELPHI, (anc. geog.), a town of Phocis fituated on the fouth-wett extremity of mannt larnalfus. It was famous for a temple and oracle of that god, of which the following was faid to $b=$ the origin: A number of goats that were feeding on mount Parnaflus came near a place which had a deep and long perforation. The Ateam which iffued from the hole feemed to infpire the goats, and they played and frifked about in fuch an uncommon manner, that the goat-herd was tempted to lean on the hole, and fee what mytteries the place contained. He was immediately feized with a hit of enthuififm, his expreffons were wild and extravagant, and paffed for prophecics. This circumitance was foon known about the country, and many experienced the fame enthufiaftic infpiration. The place was revered; a temple was foon after erceted in lionour of A pollo; and a city built, which became the chief and molt illuthrious in Phocis. The influence of its god has controlled the eouncils of flates, directed the courfe of armies, and decided the fate of kingdoms. The ancient hiftory of Greece is full of his energy, and an carly regiter of his authority. The circumjacent cities were the ftewards and guardians of the god. Their deputies compofed the famous Amphictionic aftembly, which onee guided Greece.

The tomple of Apollo, it is rehted, was at firt a

Delus, Delphi.

## D E L $\left[\begin{array}{ll}723\end{array}\right]$ <br> D E L

-Delphi. kind of cottage covered with houghs of laurel ; but he was early provided with a betwo hahitation. An edifice of fone was erected by Trophonius and Agancdes, which fubfifted about 700 years, and was burned in the year 636 after the akins of 'Troy, and $54 \$$ before Chrift. It is mentioned in the himn to Apollo aferibed to Homer. An opulent and illutrious firmily, called Alcmaonida, which had lled from Athens and the tyrant Hippias, contracted with the deputies for the building of a new temple, and exceeded their agreement. The front was raifed with Parian marble, intead of the flone called Porus; which refembled it in whitenefe, but was not fo heavy. A. Corinthian was the architect. The pediments were adoned with Diama, and Latona, and Apollo, and the Mufes; the fetting of Phobus or the fun; with Bacchus, and the women called Thyades. The architraves were deeorated with golden armotir ; bucklers fufpended by the Athenians after the battle of Marathon, and fields taken from the Gau's under Brennus. In the portico were inforibed the celebrated maxims of the foven fages of Grece. There was an image of Homer, and in the eell was an altar of Neptune, with Itatues of the Fates, and of Jupiter and Apollo, who were furnamed Leaders of the Fates. Near the hearth before the altar, at which Neontolemns the fon of Achilles was hain by a prieit, flood the iron chair of Pindar. In the fanctuary was an image of Apollo gilded. The inclofure was of great extent, and lilled with treafuries, in which many cities had confecrated tenths of fpoil taken in war, and with the public donations of renowned ftates in various ages. It was the grand repofitory of ancient Greece, in which the labours of the fculptor and fatuary, gods, heroes, and illultrious perfons, were feen collected and arranged; the inequalities of the arca or acclivity contributing to a full difplay of the noble affemblage.

The oracles were delivered by a priellefs called Pythia, who received the prophetic influence in the foliowing manacr. A lofty tripod, decked with laurel, was placed over the aperture, whence the facred vapour iflued. The prieftefs, after wafting her body, and efpecially her hair, in the cold water of Caftalia, mounted on it, to receive the divine eflluvia. She wore a crown of laurel, and thook a faered tree, which grew by. Sometimes he chewed the leaves; and the fremzy which followed may with probability be attributed to this ufage, and the gentler or more violent fymptoms to the quantity taken. In one iuflance the paroxyfm was fo terrible, that the pricits and fuppliants ran away, and left her alone to expire, it was believed of the god. Her part was umpleafant; but, if the declined acting, they dragged her by force to the tripod. The habit of her order was that of virgins. The rules enjoined temperance and chaltity, and prolibited luxnry in apparel. The feafon of encuiry was in the faring, during the month called Bufius; after which Apoho was fuppofed to vint the altars of the Hyperboreans.

The city of Delphi arofe in the form of a theatre, upon the winding declivity of Parnaffus, whofe faniaAtic tops overhaclowed it, like a canopy, on the north, while two immenfe rocks rencered it inaceeflible on the caft and went, and the rugged and hapelefs mount Cirphis defended it co the fouth. The foot of the
lath-named momitain was wanted by the tadid Fhtus, which difcharged itfelf into the fea at the ditance of only a few leagues from the facred city. I'lus inaccefdible and romatac fituation, from wheh the ptace derived the name of Dolphi (fignifying, as exphamed in the gluftrics, forary aloze), was rendered dill more Ilriking, by the innumerahle echoes which mulaplied every found, and increafed the ignorant vencration of vilitants for the god of the oracle. The artful mini. fters of Apollo erradually collected fuch ohjerts in the groves and temple as were fitted to atonifh the feafes of the admiring mulitude. The fplendor of marble, the magic of painting, the invaluable itatues of gold and inlver, 1 eprefented (to ufe the language of antiquity) not the refemblance of any earthly labitation, but rather exprefled the image of Olympus, adorned and enlightened by the actual prefence of the gods.

The protection and fuperintendence of this precions depolitory of riclues and fuperltition belonged to the Amphictyons, as already noticed. But the inhebitants of Delphi, who, if we may ufe the expreftion, were the original proprietors of the oracle, always continted to direct the religious cermonies, and to conduct the important buinefs of prophecy. It was their province alone to determine at what time, and on what oecation, the Pythia fhould mount the facred tripod, to receive the prophetic feams by which the cominu. nicated with Apollo. When overnowing with the heavenly infpiration, the uttered the confufed words, or rather frantic founds, irregularly fuggefed by the impulfe of the grod; the Delphians collected thefe founds, reduced them into order, animated them with fenfe, and adorncd them with harmony. 'The Pythia, appointed and difmilfed at pleafure, was a mere intert. meat in the hands of thofe artful minilters, whofe character became fo venerable and facred, that they were finally regarded, not inerely as atterdants and worhippers, but as the peculiar family of the grod. 'Their number was confiderable, and never exactl; afectatine ed, fince all the principal inhabitants of Delphig claiming an immediate relation to Apollo, were intitled to officiate in the rites of his fanetuary; and even the inferior ranks belonging to that facred city were continually employed in dances, fettivals, proceffons, and in difplaying all the gay pagcantry of an ainy and edegant fupertition.

Delphi was conveniently fituated for the conflux of votaries, lying in the centre of Greece, and, as was then imagined, of the univerfe. It was cuftomary for thole who confulted thic oracle to make rich prefents to the god; his fervants and prielts fealt. ed on the numerous vicims which were faceificed th him ; and the rich magnificence of his temple had become proverbial even in the age of Homer. In aftertimes, Crofus, the wealhicht of monarchs, was particularty munificent in his donations. This faered repolitory of opulenee was therefore often the object of plander. Ňoptotemus was flain, while facrificing, on fufpicion of a defign of that kind. Xerses divided his army at Panopens, and proceeded with the main body through Bocotia into Attica white a party, keeping Parnaffus on the right, advanced along Schife to Ddphi; but was taken with a panic when near llium, and fled. This monarch, it is ulated, was as well apprifed of the contents of the

DeIphlinium, dolphin-flower, or lara- Deiphi SPUR: A grinus of the trigynia order, belonging to minm, the polyandria clafs of piants; and in the natural methed ranising under the 2 Gth order, Mulifiliqua. There is a calyx; the peials are five; the nectuman bifid, and honsed belhind; the fliqure three or one. There are feren fuecies; four are cultuated in gardens. Two of thele are annual, and two perennal. Tlicy are herbaccous plants of upright growth, rifing from 18 inches to four feet in height, garmihed with finely divided leaves, and terminated by long pipikes of pentapetalous llowers of bline, ied, white, or violet colours.- One fpecies, the confolida, is found wild is feveral paits of Britain, and grows in curr-fields. According to Mr Witluering, the expeffed juice of the petals, with a little alum, makes a good blue ink, 'The feeds are acrid and poifotous. II hen cultivated, the bluftoms ofton become double. Shetp and goats eat this plant: horfes are not fond of it: cows and fwine vefufe it.- The frit imentioned fpecies makes a very tine appearance in gardens, and is cathly propagated by feeds; being fo hardy, that it threves in any fuil or fatuation.
DELPHINUS, or DOL?HIN; a genus of fifhes belonging to the order of Cete. There are three fpecies.
I. The delf binus, or dolphin. Hiforians and philofophers feen to have contended who fhould invent moll fables concerning this filh. It was confecratco to the gods, was celcbrated in the earlicat thone for its fonduefo of the human race, was hononred with the title of the facreif filb, and dittinguintal by thoie of bov-lozirg and polluntorofigl. It gave rife to a long train of inventions, prouls of the credulity and ignorance of the times. Ariatote feers the clearelt of all the ancients from thele fables, and giees in general a faithen hitory of this animal; bat the elder Piny, Aliza, and others, feem to preferve no bounds in ther bulicf of the talss related of this fin's attachment to manhind. Scarce an accident could happen at fea, but the dolphin offered himfelf to convey to thore the unfortunate. Arion the mbician, when flung into the ocean by the firateo, is seceived and faved hy this benevolent fifh.

Requite, his be rer for ha fries ly y parn.
We are at a lofs to accuant fur the origin of thofe fables, fince it does nut appear that the dulphin fhows a greater attachment to mankind than the reft of the cctaceous tribe. We koow that at prefont the appearance of this filh, and the porpofit, are far from being effeemed favourable omens by the feamen; for their boundings, iprings, and frolics, in the water, are held to be fure figns of an app:oaching gaie.

It is from their leaps out of that element, that they allume a temporary furm that is not natural to them; but which the uld painters and fculptors have almoft always given them. A dolphin is fcarce ever exhitited by the ancients in a flraight hape, but alrutt al-

Iethinus, itstail infwinming; for it bends that part under it, as Deluho. a lobfler does its tail, and works it with fuch force as to dart along with the rapidity of an arrow. It is common in all the Arctic feas a and foms an article of commerce, being taken on accuunt of itz blubber. They are numerous in the Culph of St Lamenee, and go with the tide as highas Qucbec. 'There are ntheries for them and the common porpeffe in that river. A confiderable quantity of oil is extracted; and of their fims is made a fort of Morocco leather, thin, yet ftrong enough to refint a mufket-ball. They are frequent in the Dwina and the Oby ; and go in finall families from five to ten, and advance pretty far up the rivers in purfuit of fith. They are ufually caught in nets, but are fometimes harpooned. 'They bring only one young at a time, which is dufly; but grow white as they advance in age, the clange firft commencing on the belly. They are apt to follow boats, as if they were tamed: and appear extremely beautiful, by reaion of their refplendent whitenefs.

Delphinus, in aftronomy, a conftllation of the northern hemifphere.

DELPHOS, a town, or rather village, of Turky in Afia, in the province of Libadia; occupying part of the fite of the ancient Delphi. See Delfhi.

A late traveller $\dagger$ informs us, that fome veftiges of fide, are fepulchres, niches with horizontal cavities for
which the Putha, and the poets who verfifed her anfwers, were believed to derive a large thare of their infiration, defcends through a cleft of Parnaffus; the rock on each fide high and feep, ending in two fummits; of which one was called $H j^{\prime}\left(u n n^{\prime} a\right.$, and had beneath it the facred portion of Autonous, a local hero as diftinguithed as Phylacus. From this precipice the Delphians threw down the famous IEfop. By the fleam, within the cleft, are fien fmall broken ftairs leading to a cavity in which is water, and once perhaps up to the top. Grooves have been cut, and the marks of tools are vilible on the rock; but the curreat, inflead of fupplying a fountain, now pafles over its native bed, and hattens down a courfe deep-worn te join the Pleitus. Clofe by, at the foot of the eattern precipice, is a bafin with fteps on the margin, once, it is likely, the bath ufed by the Pythia. Above, in the fide of the mountain, is a petty church dedicated to St John, within which are excavations refeinbling niches, partly concealed from view by a tree.

DELTA, is a part of Lower Egypt, which takes up a confiderable fpace of ground between the branches of the Nile and the Mediterranean Sea: the ancients called it the Ijle of Delta, becaufe it is in the hape of a triangle, like the Greek letter of that name. It is about 130 miles along the coalt from Damietta to Alexandria, and 70 on the lides from the place where the Nile begins to divide itfelf. It is the motl plentiful country in all Egypt, and it rains more there than in other parts, but the fertility is chiefly owing to the inundation of the river Nile. The principal towns on the coaft are Damietta, Rofetta, and Alexandria; but, within land, Menoufia, and Masha or Elmala.
1)ELTOIDES, in anatomy. Sce Anatomy, Table of the Mufcles.

DELUGE, an inundation or overflowing of the earth, either wholly or in part, by water.

We have feveral deluges recorded in hitory; as that of Ogyges, which overflowed almoft all Attica; and that of Dencalion, which drowned all Theffaly in Greece: but the molt memorable was that called the Univeirfal Deluge or Noal's Flont, which overflowed and dettroyed the whole carth; and from which only Noah, and thofe with him in the at $k$, efeaped.

This flood makes one of the moft confiderable Era of the epochas in chronology. Its hiftory is given by Mofes, the deluge Gen. ch. vi. and vii. Its time is fixed, by the beit chronologers, to the year from the ereation 16156 , anfwering to the year before Chrit 2293. Prom this flood, the ftate of the wonld is divided into diturian and anteliluvian. See Antfoluvians.

Among the many tellimonies of the truth of this part of the Mofaic hillory, we may aecome the general voice of mankind at all times, and in all parts of the world. The otjections of the free-thinkers have indeed principally turned upon three points, viz. I. The objection want of any direct hiftory of that erent by the profane writers of antiquity; 2, the apparent imponinility of accounteng for the quantity of water necthary to overfow the whole earth to fuch a depth as it is faid to have been: and, 3. there appearing ${ }^{\text {non }}$ necelity for an unverial duluge, as the fane end might hase been accomplithed by a partial one.
I. The former of thefe ohjections has given rife to feveral very elaborate treatifcs, though all that has yet
the body, fome covered with flabs. Farther on is a niche cut in the rock with a feat, intended, it feems, for the accommodation of travellers wearied with the rugged track and the long afcent. The monaitery is on the fite of the Gymnatium. Strong terrace walls and other traces of a large edifice remain. The village is at a diftance. Caftalia is on the right hand as you afcend to it, the water coming from on high and crofling the road; a fteep precipice, above which the mountain Itll rifes immenfely, continuing on in that direction. The village confilts of a few poor cottages of Albanians covering the fite of the temple and oracle. Beneath it to the fuuth is a church of St Elias, with artas, terrace walle, arches, and veftiges of the buildings once within the court. The concavity of the rock in this part gave to the fite the refemblance of a theatre. Turning to the left hand, as it were toward the extremity of one of the wings, you come again to fepulhes hewn in the rock, and to a femicircular recels or niche witla feat as on the other fide. Higher up than the village is the bollow of the Stadium, in which were fome feats and featrered fragments.

Higher up, within the village, is a piece of ancient wall, concealed from view by a thed, which it fupports. The tone is brown, rough, and ordinary, probably that of Parnaflus. On the fouth fide are many inferiptions, with wide gaps between the letters, which are negligently and faintly cut; all nearly of the fame tenor, and very dificult to copy. They regifter the purchafe of haves who had entrulled the price of their freedom to the god; containing the contract between Apollo and their owners, witneffed by his priefts and by fome of the archons. This remnant feems to be part of the wall before Caffotis; as above it is fill a fountain, which fupplics the village with excellent water, it is likely from the ancient fource.

The water of Caftalia in the neighbourhood, from

## D E L [ 727 ] D E L

Delage. Eeen dune in this way has fcarcely been ahle to litence the objectors. Mr Bryant, in his SyRem of Mytholory, has with great learning and confiderable fuccefs endeavoured to tho:v, that the deluge was one of the principal, if not the only foundation of the Gentile worthip; that the frit of all their deties was Noah ; that all nations of the word look up to him as their founder; and that he, his fons, and the firit patiarchs, are alluded to in moft if not all of the religions ceremonies not only of the ancient but of the modern heathens. In fhort, aceording to this author, the deluge, fo far from being forgot, or oblcurely mentioned by the heathen world, is in reality confpicuous throughout every one of their ants of religions worthip.

The Kgyptian Ofiris, aceording to him, was the fame with Ham the fon of Noah, though the nane was fometimes beflowed on Noah himfelf. 'I'hat this is the cafe, is evident, he thinks, from its being faid that he was expofed in an ark, and afterwards reltored to day; that he planted the rine, tautht mankind agriculture, and inculeated upon them the nusims of religion and juttice. Sumcthing of the fame kind is related of Perfeus. He is reprefented by fome ancient hiltorians as a great altronomer, and weld verfed in other feiences. After being conctived in a thower of gold, he was expofed in an ark upon the waters, and is faid to have had a renewal of life. - The hitory of Myrina the amazon afford a kinds of abridgement and misture of the hiftories of Otiris and Perfens. Similar to thefe is the hiftory of Hercules himfelf. But our author obferves, that under the titles of Ofiris, Perfeus, Myrina, \&c. the aneients lyoke of the exploits of a whole nation, who were no other than the Cuthites or Cuthites, the defcendants of Cufh the fon of Ham and father of Nimrod. Thefe people fpread thenfelves into the moll semcte corners of the glohe; and heace the lecroes whom they reprefented are always fot forth as conquering the whole world. - According to Dirdorus Siculns, the Egyptian Ofris was the fame with the Dionyfus of the Gieeks. He is faid to have been twice born, and to have had two fathers and two muthers; to have been wonderfully preferved in an ark; to have travelled all over the earth; taught the ure of the vine, to build, plant, \&e. The Indians clam hin as a mative of their country, thungh fome allow that he came from the well. Of Cronus and Allurte, it is faid that they went over the whole cath, dispofing of the countries as they pleafed, and doing good wherever they came. The fame is related of Ouramus, Themis, Apollo, \&c. though all their exploits are faid to have been the effects of conqueit, and their benevolence enforced by the fword. In a fimilar manner he explains the hiltories of other heroes of antiquity : and having thus, in the chasacters and hiltory of the molt celebrated perfonages, found traces of the hittory of Noah and his family, our author procecds to inquire finto the menorials of the deluge itfelf to be met with in the hitory or religious rites of the different nations of antiguity. timenics's We may reafonably fuppofe (fays he), that the parthe deticulars of this extraordinary event would be gratcfully commemorated by the patriarch himfelf, and tranfmitted to evely branch of his family; that they were made the fuhject of dometlic converic, whese
the biftory was often renewed, and ever attended with
Deluge. a rerecntial awe and horror, efpecially in thofe who had been witneffes to the calamity, and had experienced the hand of Providence in their favour. In procefs of time, when there was a falling off from the truth, we might farther expect, that a perfon of fo ligh a character as North, fo partioularly dittinguifhed by the Deity, could wot fat of being reverenced by his potlerity; and, when ikolatry prevaited, that he would be one of the firt amoug the fons of men to whom divine honomrs would be paid. Lattly, we might conclude, that the fe memorials wouid be interworn in the mytholosy of the Gentile world; and that there would be continual allutions to thefe ancient occurrences in the rites and myftries as they were practifed by the nations of the earth. In conformity to thefe fuppolitions, I fall endeavour to thow that thefe thinos did happen; that the hiilory of the deluge was religinuly prefered in the firft ages; that every circumflance of it is to be net with among the hiforians and mythologits of different countrics; and traces of it are to be fonnd particularly in the farered rites of E gypt and of Greece.
" It will appear from many circumfances in the Various more ancient writers, that the great patriarch wastities by highly reverenced by his potterity. They looked up which to him as a perfon highly favoured by heaven; and ho- Nitah was noured him with many titles, eaeh of which had a re-detinguld. ference to fome particalar part of his hiltory. They fyled him Promathous, Deucalion, Atlus, Theuth, Zuth, Xubus, Inalbus, oferis. When there began to be a tendency towards idolatry, and the adoration of the fun was introduced by the polterity of Ham, the title. of Hellus, anong others, was conferred upon him. They called him alformand mav, which is the moon. When colonies went abroad, many took to thenfelves the title of Ningole and Minyef from him; jult as others were dencenimated Achomonisle, Amita, Holiatio, from the fun. l'eople of the former name are to be found in Arabia and in other parts of the world. The natives at Orchomenos were fteled Minver, as were fonc of the inlabitants of 'Theffaly. Noah was the original Zeus and Dios. He was the planter of the viar, and inventor of fermented liquors: whence he was denominated Zeath, which lignifies ferment, rendered Zous by the Greeks. He was allo called Dion nufos, interpreted by the Latins Bacchus, but very improperly. Bacchus was Chus the grandion of Noah; as Ammon may in general be efteened Ham, fo much reverenced by the Egyptians.
"Among the people of the eatt, the true name of the patriatch was preferved ; they called him Noas, Nuss, and fometimes contracted Nous; and many places of tanctity, as well as rivers, were denominated from him. Anaxugeas of Clazomene had obtained Some knowlelge of him in Egyet. Fy him the patharch as denominated Nias or Nous; and both he and his dilciples were inntible that this was a foreign appellation; notwithtanding which he has acted as it it had boen a tern of the Cocek language. Eulebius informs us, that the difcinles of Anaxagores fay, 'that Nous is by interpretation, the deity I is or Dios; and they likewife ctlem Nous the fame as Promethenc, becaufe he was the renewer of mankind, and wor fail is hare fandion ot thens again. ator they

## D E L [728] D E L

Drugc. had been in a manner extinct. After this, however, he gives a fulution of the Hory upon the fuppofition that Nous is the fame with the Greek word ves the mind ; that 'the mind was Promethsia; and I'rometheus was faid tos renew mankind, from new forming their minds, and leading them, ly cultivation, from ignoranct.'
"Suidas has preferved, from fome ancient anthor, a curious memorial of this wondenfulperfonage, whom he aftects to dittinguih from Dencalina, and Ayle Nonnacus. According to him, this Namacus was a. perfon of great antiquity, and prior to the time of Dencalion. He is faid to have been a king, who, forfecing the approaching deluge, collected every hody together, and led them to a temple, where he offered un his prayers for them, accompanied with many tears. There as likewife a proverhial exprefion shout Nanacus applied to people of great antiçuity.
"Stephanus gives great light to this hiftory, and fupplies many deficiencies. 'l'the tradition is (fays he), that there was one formerly named Annucus, the extent of whofe life was above 300 years. The people who were of his neighborthood and aequaintance had inquired of an oracle how long he was to live: and there was an anfwer given, that when Annacus dicd, all mankind wond lie deltroyed. The Phrygians, upon this account, made great lamentations, from whence arofe the proverb to eta A wownoxavativ, the lupentutich for Annacus, made ufe of for people or circumfances highly calamitons. When the flocd of Dewealion came, all mankind were dettroyed, according as the oracle had foretold. Afterwards, when the furface of the earth began to be again dry, Zeus ordered Prometheus and Minera to make images of clay in the form of men: and, when thry were finifhed, he called the winds, and made then breathe into each, and render then vital.'

From thefe hitories Mr Bryant concludes as fullows: "However the fory may have hetw varied, the prineipal outlines plainly point out the pafon who is athuded to in the fe hireries. It is, I think, manifift, that Annacus, and Nannacus, and even Inacus,

Inachus,
Deucation and Prometheus, the fame wish Noah relate to Noachus or Noah. And not only thele, but the bitories of Dencalion and Pronetheus have a like reference to the pariarch; in the Gooth year, and not the 3octh, of whofe life the waters prevailed upon the earth. He was the futher of mankind, who were renewed in him. Hence he is rejrefonted by another author, under the charakter of Pronetheus, as a great artit, by whom men wore formed ancw, and were inltructed in all that was sood.
"Noah was the original Cronns and Zeus; though the latter is a title conferred fometines upon his fon Ham. There is a very particular expreffion recorded by Clemens of Alexandria, and attributed to Pythaforas, who is faid to have called the fea the tear of Cronus : and there was a farther tradition concerning this perfon, that he drank, or fwallowed, up all his children. The tears of llis are reprefented as very myterinus. They are faid to have flowed whenever the Nile began to rife, and to flool the country. The averfowing of that river was the great fource of affluence to the people, and they louked upon it as their $\mathrm{N}^{\mathrm{O}} 92$.
chicf bleffing; yet it was ever attended with myflical tears and lamentations. 'This was particularly obferved at Coptos, where the principal deity was Ifis. An ancient writer imagines that the tears and lamentations of the people were to implore an inundation ; and the tears of Ifis were fuppofed to make the river fwell. But all this was certamly faid and done in memorial of a former flood, of which they made the overflowing of the Nile a type.
"As the patriarch was by fome reprefented as a king ealled Noachus and Nauclus; fo by others he was flyled Inachus, and fuppofed to have reigned at Argos. Hence Inachus was made a king of Greece; and Phoroneus and Apis brought in fucceffion after him. But Inachis was not a name of Grecian original : it is mentioned by Eufebius, in his account of the firt ages, that there reigned in E.gypt 'Telegonus, a prince of foreign extraction, who was the fon of Ones the thepherd, and the feventh in defcent from Inachuus. And in the fame author we read, that a colony went forth from that country into Syria, where they foundel the aneient city of Antioch: and that rhey were condueted by Cafus and Belus, who were fons of Inachus. By Inaehus is certainly meant Noaln: and the hifory relates to fome of the more exaly defeendants of the patiarch. His name has been renderel very unlike itfelf, by having been lengthened with turminations, and likewife fothioned according to the idiom of different languages. bout the cicumances of the hifory are to precife and particular, that we eannot mifs of the truth.
"He feems in the eat to have been called Noas, N"afis, Nufue. and $N_{u s}$; and by thre Greeks his name was compounded Dionufus. The Annonians, wherever they came, founded cities to his honour: hence places callict Nufa will often occur; and indeed a great many of them are mentioned by aneient authors. Thefe, thoush widely diftant, being fituated in countries far removed, yet retained the fame original hittories; and were generally famows for the plantation of the vine. Milled by this fimilarity of traditions, people in afte: times imagined that Dionufus mult neceffarily have been where his hillory oceurred: and as it was the turn of the Greeks to place every thing to the account of conquel, they made him a great conqueror, who weent over the face of the whole earth, and tanght mankined the plantation of the vine. We are informed, that Dionnfus went with an army over the face of the whole earth, and tanght mankind, as he paffed along, the method of planting the vine, and how to prels out the juice, and receive it in proper veffels. Though the patriarch is reprefented under varions titks, and even there not always unifornly appropriated; yet there will continually occur fueh peculiar circumblanecs of his hiltory as will plainly point out the perfon referred to. "The perfon preferved is always mentioned as preferved in an ark. He is deferibed as being in a tute of darknels, which is reprefented allegorically as a fiate of death. He then obtains a new life, which is called a feend birth; and is faid to have his youth renewed. He is, on this account, looked upon as the finft-born of mankind; and both his antediluvian and pootdiluvian flates are commemorated, and fometimes the intermediate ftate is allo fpoken of. Dindorus calls him Deucalion; but deferibes the deluge as

## D E I.

Deluge. in a manner univerfal. 'In the deluge which happened in the time of Deucalion, almoll all fefl died.' Apollodorus having mentioned Deucalion io axgraxs, configned to the ark, takes notice, upon his quitting it, of his offering up an immediate facrilice to the God who delivered him. As he was the father of all mankind, the ancients have male him a perfon of very extenfive rule; and fuppofed him to have been a king. Sometimes he is deferibed as a monarch of the whole earth; at other times he is reduced to a petty king of Theffaly. He is mentioned by Helladias in this latter capacity; who fpeaks of the deluge in his time, and of his building altars to the gods. Apollonius Rlodius fuppofes him to have been a native of Greece, according to the common notion : but notwithftanding his prejudices, he gives fo particular a character of him, that the true hiftory camot be mittaken. He makes him indeed the fon of Prometheus, the fon of Japetus; but in thefe ancient mythological accounts all genealogy muit be entirely difregarded. Though this character be not precifely true, yet we may learn that the perfon reprefented was the firt of men, through whom religious rites were zenewed, cities built, and civil polity effablifhed in the world: none of which circumplances are applicable to any king of Grecee. We are affured by Philo, that Deucation was Noah; and the Chaldeans likewife mentioned him by the name of Xifuthrus, as we are informed by Cedrenus.
"That Deucalion was unduly adjudged by the people of Theffaly to their country Tolely, may be proved from his name occurring in different parts of the world, and always accompanied with fome hiltory of the deluge. The natives of Syria laid the fame claim to him. He was fuppofed to have founded the temple at Hierapolis, where was a chafm through which the waters after the deluge were faid to have retreated. He was likewife reported to have built the temple of Jupiter at Athens; where there was a cavity of the fame nature, and a like tradition, that the wates of the flood paffed of through this aperture. Howerer groundlefs the notions may be of the waters having retreated through thefe paffages, yet they fhow what impreffions of this event were retained by the Amonians, who intioduced fome hiftory of it where ever they came. As different nations fuccecded one another in thefe parts, and time produced a mixture of generations, they varied the hiftory, and modelled it according to thcir notions and traditions; yet the ground-work was always true, and the event for a long time univerially commemorated Jofephus, who feems to have been a perfon of extenfive knowledge, and verfed in the hiflories of nations, fays, that this great oeeurrence was to be met with in the writings of all perfons who treated of the firl ages. He mentions Derofus of Chaldea, Heronymus of Egy pt, who wrote ceneerning the antiquities of Plenicia; alfo Alnafeas, Abydenus, Melon, and Niculaus Damafeenus, as writers by whom it was recorded ; and adds, that it 3 was takea motice of by many others.
Accountsof " Among the enftern nations, the traces of this he fond event are more vivil and determinate than thofe of mong the Grece, and morecernformable to the accounts of Mo-
ander this purpofe from Abydenus; which was taken from Vol. V. Part II.
the archives of the Medes and Babylonians. This Deluge. writer fpeaks of Noath, whom he names Seifithrus, as a king; and fays, that the food began upon the $\mathrm{F}^{\mathrm{g} \text { th }}$ day of the morth Defius: that during the prevatence of the waters, Seilithrus fent ont birds, that he might judge if the flood had returned: bot that the birds, not finding any refling place, returned to him again. This was repeated thrie times; when the binds were found to return with their feet fained with foil; hy which he knew that the flood was abated. Upon this he quitted the ark, and was never more feen of men, being taken away by the gods from the earth. Aby:denus concludes with a partieular, in which the eallern writers are unanimous; that the place of defcent from the ark was in Armenia, and fpeaks of its remains being preferved for a long time. Plutarch mentions the Noachic dove, and its being fent out of the ark. But the moft particular hiftory of the deluge, and the neareft of any to the account given by Mofes, is to Le found in Lucian. He was a native of Sumofata, a eity of Comagene, upon the Euphrates, a pait of the world where memorials of the deluge were particularly prefersed, and where a refcrence to that hiftory was continually kept up in the rites and worthip of the country. His knowledge therefore was obtained from the Afiatic nations among whom lie was burn, and not from his kinfinen the Helladians, who were far inferior in the knowledge of ancient times. He ds. fcribes Noah under the name of Deucalion; and fayz, 'that the prefent race of mankind are different from thofe who firt exifted; for thofe of the antediluvian world ware all deftroyed. The piefent world is peoplet from the fons of Dencalion; hasing inereafed to fog great a number from one perfon. In refpect to the former brood, they were men of violence, and lawefs in the:r dealings. They regarded not oaths, ner obferved the rights of hofpirality, nor fhowed mercy to thofe who fued for it. On this account they were doom. ed to deftruction: and for this purpofe chere was a mighty eruption of waters from the carth, attended with heavy fhowers from above; fo that the rivers fwelled, and the fea overflowed, till the whele earth was covered with a food, and all llefl drowned. Dencalion alone was preferved to repeople the worle. This mercy was thown to him on aceount of his pisty and juttice. His prefervation was effected in this manner: He put all his family, beth his fors and their wives, into a vall ark whieh be had provided, and he went into it himelf. Ai the fame time animals of every fpecies, boars, horfes, lions, ferpents, whatever lived uyon the faee of the earth, fullowed him by pains: all whith he received into the ank, and cxperitacel no evilf from th.om ; lor there previled a wonderfol harmony throughont, by the immediate influence of the Deity. Thas were th.y wafecd with him as long as the flood endured.' After this he procetds is mention, that, upon the colfapteaing of the waters, Ducalion went furth from the ark, and raifd an ahar 10 God; but he trantpofs the feene to Hicma, ilis in Syria, where the natives pretended, at has bean alretdy mentioned, to bave very paticular inemonials of the deluge.
"Moll of the authors who hase tranfaisted to us F.canara'e thefe accounts, at the fame time inform we, that the the ar font romairs of the ark were to be feen in thon cias on one n! dee

## D E L [ 730 ] D E L

of the monntains of Armenia. Abydenus particularly fays, in confrmation of this opinion, that the people of the country ufed to get fnall pieces of the wond, which they carried about by way of amulet. And Besefus mentions, that they foraped off the afphaltus with which it was covered, and ufed it as a charm. Some of the fathers feem to infla on the certainty of the ark being thll remaining in their time. Thenphil is fays exprefily, that the remains were to befeen upon the mountains of Aram, or Armenia. And Chryfoftom appeais to it as to a thing well known. "Do not (lays he) thofe ponuntains of Armenia hear witnefs to the truth? thofe mountains where the ark firlt reled: And are not the remains of it preforved there even untn thes day ?
"Therenvis a cutom among the pritits of Amon, of carrying a boat in proceflou at particular fenions, in which was an oracular flatine held in great vereration. They were faid to have been 80 in number, and to hove carried the facsed veflel about jut as they were directed by the impulfe of the Deity. This chftom was likewife in ufe among the Eeyptians; and bithop Pocock has preferved three fpecimens of ancient foldpture, wherein this curemony is difolayed. They are of wonderful anticuity, and were fund by him in Upper Egypt.

Put of the cetremony in moft of the ancient myferies confled in carnying atout a fhip or boat; which cuftom, upon due examimation, will be found to relate to nohing elfe but Noah and the deluce. The Mip of Ifs is well known, and the feltivity among the Egyptians whenever it was carried in public. The name of this, and of all the navicula flrines, was Ba ris; which is remarkable: for it was the very name of the monntain, accorlang to Nicolaus Damalcenus, on which the ark of Noah retted, the fame as Ararat in Armenia. He mentions, that there is a large mountain in Armenia, which ftands above the country of the Minyæ, called Raris: to this it was faid that many peotle betook thenlelves in the time of the deluge, and were faved; and there is a trabition of one perfon in particular floatincr in an ark, and arriving at the furmi: of the mountain. We may le afured then, that the flip of Ilis was a facred emblem ; in honour of which there was among the Egrptians an annual reftival. It was in after times admitted among the Romans, and let down in their kalendar for the month wf March. The former, in their defeription of the primary deities, have continually fome reference to a Anip or hoat. Hence we frequently read of $\Theta$ eos vurtadoutes (failing godi). They oftentimes, fays Porphyry, deferibe the fun in the character of a man lailing upon a fluat. And Plutarch oblerves to the fame purpofe, that they did not reprefent the fun and the moon in chariote, bat ceiffed about uponflating matbones. In doing which they did not refor to the luminaries, but to a perfon reprefented under thole titles. The fun, or Orus, is likewife delcribed by Jamblichusas fitting upon the lotis, and failing in a veffel.
"It is faid of Sufoitris, that he conftructed a thip which was 280 cubirs in length. It was of cedar, plated without with goll, and inlaid with flaver; and it was, when finihed, dedicated to Ofris at Thebes. It is not credible that there fhould have been a flip of whis laze, efpecially in an inland difriet, the molt re-
mote of any in Egypt. It was certainly a temple and a thrinc. The former was framed upon this large fale; and it was the latter on which the gold and filver were fo lavifhly expended. There is a remarkable circumftance relating to the Argonautic expedition; that the dragon flain by Jafon was of the lize of a trireme; by which muft be meant, that it was of the thape of a hip in general, for there were no triremes at the time alluded to. And I have moreover fown, that all thefe dragons, as they have been reprefented by the poets, were in reality temples, Dracomia; where, among other rites, the worthip of the ferpent was inflituted. There is therefore reafon to think, that this temple, as well as that of Sefoltris, was fahioned, in refpect to its fuperficial contents, after the model of a thip; and as to the latter, it was probably intended, in its oatlines, to be the exact reprefentation of the ark, in commemoration of which it was certainly built. It was a temple facred to Ohinis at Theba; or, to fay the truth, it was itfelf called Theba; and both the ciry, haid to be one of the moft ancient in Egypt, as well as the province, was undoubtedly denominated from it. Now Theba was the name of the ark. It is the very word made ufe of by the facted writer; fo that we max, I think, be affured of the prototype after which this temple was fahioned. It is faid indeed to have been only 280 cubits in length: whereas the ark of Noah was 300 . But this is a variation of only one-fifteenth in the whole: and as the ancient cubit was not in all countries the fame, we may luppofe that this difparity arofe rather from the manner of meafluring than from any real difference in the extent of the building. It was an idolatrous temple, faid to have been buile by Sefoltris in honour of Otizis. I have been repeatedly obliged to take notice of the ignorance of the Greeks in refpect to ancient title's, and have fhown their mifapplication of terms in many inftances: efpecially in their fupponing temples to have been ereeted by perfons to whom they were in reality facred. Sefoltris was Ofris; the fame as Dionufus, Menes, and Noah. He is called Seifitbrus by Abydenus; Xixouthros by Berofus and Apollodorus; and is reprefented by them as a prince in whofe time the deluge happened. He was called Zuth, Xuth, and Zous; and had certainly divine honours paid him.
"Puuanias gives a remarkable account of a temple other em of Hercules at Eruthra in Ionia; which he mentions blematical as of the highett antiquity, and very like thofe of reprefentan Egrpt. The deity was reprefented upon a float, and was luppofed to have come thither in this marner from Phevicia. Ariftides mentions, that at Smyrna, upon the fealt called Dionyfa, a fhip ufed to be carried in proceffor. 'The fame cutom prevailed ansong the Athenians at the Panathenæa; when what was termed the facred fhip was horne with great reverence through the city to the temple of Dameter at Eleufis. At Phaicrus, near Athens, there were honours paid to an unknown hero, who was reprefented in the itern of a fhip. At Olympia, the mot facred plave in Greece, was a reprefentation of the like nature. It was a building like the fore-part of a Cnip, which flood facing the end of the Hippodromus; and towards the middle of it was an altar, upon which, at the renewal of each Olympiad, certain rites were performed.
"I think it is pretty plain that all there emblema-

## D E L

Deuge. tical reprefentations, of which I have given fo many initances, related to the hiftory of the deluge, and the confervation of one family in the ark. This hiflory was pretry recent when thefe works were executcd in Egypt, and when the rites were firlt ellablifhed; and there is reaton to think, that in carly. times modt thrincs of the Mization were formed under the refemblance of a fhip, in memory of this great event. Nay, farther, both thips and temples receival their names from thence; being fyled by the Greeks, who borrowed largely from Egypt, wavs and Nom, and mariners Navras, Nauta, in reference to the parriarch, who was varioufy Hyled Nous, Nous, and Nouls.
"Hewever the Greeks may, in their my Iteries, have fometimes introduced a thip as a fymbol, yet in their references to the deluge itfelf, and to the perfons prefervod, they always freak of an ark. And though they were apt to mention the fame perfon under various titles, and by thefe means diferent peopie feem to be made principals in the fame hiftory; yet they were fo far uniform in the ir account of this particular event, that they made each of them to be expofed in au ark. Thus it is faid of 1)cucalion, Perfeus, and Dionufus, that they were expofed upon the waters in a machine of tlis fabric. Aconis was hid in an ark by Venus, and was fuppofed to have been in a llate of death fur a yaar. Theocitus introduces a palteral porfonage named Comates, who was expofed in an ark for the fame term, and wonderfully preferved. Of Ofris being expofed in an ark we have a very remarkalle account in Plutarch; who mentions, that it was on account of $T_{\text {ython, }}$ and that it happened on the 1 th of the month Athyr, when the fun was in Scorpoo. This, in my judgment, was the precife time when Noalh entercd the ark, and when the flood came, which, in the Egtptian mythology, was called Ty-
" Typhon is one of thofe whofe charater has been greaty confounded. This has arifen from two different perfonages being incluced under one name, who undoultedly were diftinguithed in the language of $E$ gypt. Typhon was a compound of Tuph or TuphaOn; and lignified an high altar of the Deity. There were fereral fuch in Egypt, upon which they offered human facrifices; and the citios which had thefe altars were flyled $T_{y}$ thonich. But there was another 'fyphon, who was very different from the former, howwor by mifake blonded with that character. By this was dignified a mighty whirwind and inundation: and it oftentimes denoted the ocean; and particularly the oecom in a ferment. For, as Plutarch obferves, by Typhon was undertood any thing violent and unvily. It was a derivative from Tuph, like the fomer name; which T'uph fecms here to have been the fane as the Suph of the Hebrews. By this they denoted a whirlwind; but among the Igyyptians it was taken in a greater latitude, and fegntied any thing boillerons, particularly the fea. Plutarcl, fpeaks of it as denoting the fea; and fays likewife, that the falt of the fa was called the fuam of Typhon. It fignified alfo a whirlwind, as we learn from Euripides, who exprefies
it Thuphos; and the like is to be found in Hefychius, Defure. who calls it a viotent wind.
"The hithoy of Typhon was taken from hicroglyphical deferiptions. In thefe the dove, oinas, was repafented as hovering over the mundane ege, which was expofed to the fury of Typhon: For an egt. containing in it the clements of life, was thought ion impoper emblem of the ark, in which were priferved the rudiments of the future world. Flence in the Dionufiaca, and in other mytheries, one part of the nocturnal ceremony confitad in the confecration of an egy. By this, as we are informed loy Rophyyy, was fignified the world. This world was Noald and his fumily; even all markind, melofed and preferved in the ark.
"In refpect to Typhon, it muft be confofed that the hitlory given of him is attended with fome obfenrity. The Grecians have comprebended fueval charakters under one term, which the Egyptians undoubtedly diftinguilled. The term was uted for a titite as well as a name; and feveral of thofe perfonares whicta had a relation to the deluge were flyled 'Typhonian or Dihurian. All theie the Grecians have incloded under one and the fame name 'I'yphom. 'Thes seal deity ly whom the deluge was brought upon the carth had the appellation of T'yphonian, by which was meat. Diluria Das ( 1 ). It is well known that the atk was conllructed by a divine commillion; in which, whea it was completed, God inclufed the patriarch and his fanily. Hence it is faid, that 'lyphon made an ark of curious workmanflip, that he might difpofe of the body of Cfiris. Into this Ofris entered, and was thut up by Typhon. All this relates to the Typhonian decity who inclofed Noah, together with his family, within the limits of an atk. The patriarch alfo, who was thus intercllod in the event, had the titie of Ty phonian. I have flown that the ark by the mytio. logits was fpoken of as the mother of mankind. The flay in the ark was lowked upon as a thate of death and of regeneration. The pallage to life was through the foor of the ark, which was formed in its lide. Through this the parriarch made his defcent ; and at this point was the commercement of time. This hisftory is obfcurely alluded to in the account of 'lyphon ; of whom it is fadd, that witheut any regard to time or place, he forced a paflage and burf into light obliquely through the fide of his mother. This retum to light was defribed as a revival from the grave; and Piutareh accordingly mentions the retmon of Olinis from Hakes, aftur he lad been for a long feafon inclofed in an ark and in a fate of death. This renewat of life was by the Egyptians eftermed a fecond flate of childhood. 'Ihey accordingly, in their hicruglyphics, deferibed hin as a hoy, whom they plactd upon the lotoo or water-filv, and called him Orus. He was the fuppofed fon of lifis; but it has becn hown that lis, Rhea, Atargatis, were all emblems of the ark, that receptucle which was 1 yled the mother of mankind. Orus is reprefonted as undergoing from the Titans all that Ofinis fulfered from Typhon; and the lifitory at bottom is the fame. Hence it is faid
$4 Z 2$
暗
(3) "Plutarch owns that the Egyptians in fome inflances eftemed Typhon to be no other than Helius the chief deity ; and they were in the fight, though he will not allow it."

## DE L

Deluge. of Ifs, that the had the power of making people inmortal ; and that when the found her lon Crus, in the midlt of the waters, dead through the malice of the Titans, the not only gave him a renewal of life, but alfo conferred upon him immortality."

In this manner does our author deeypher almof all the ancient fables of which no fatisfactory fulution wa. ever given before. The hows that the primitive gods ut Egyp, who were in number eight, were no other than the eight parlors laved in the ark; that almond all the hesthen defies had one way or other a reference to Noah. He hows that he was characterifed under the titles of Janus, Nereus, Proteus, Dames, Dagon, Exc. Eve. and in fort, that the deluge, fo far from being unknown to the leathers, or forgot by them, was in a manner the hafts of the whole of their wot hip. He traces the hifory of the raven and dove int forth by Noah in the cattoms of various nations, not only in the catt but the wet t aloin. Of the numberless tefitmonies of the truth of this part of faced hithory to be met with among the wetter nations, however, we shall select one more, which is an ancient coin vitally
If of known by the name of the Apamean medal. "The the $A_{j}{ }^{2}$ learned Falconerius (fays Mr Bryant) has a cumean mecall. rious differtation upon a coin of philip the Elder, which was truck at Apamea (B), and contained on its reverie an epitome of this hiltory. The reverse of mot Afratic coins relate to the religion and mythology of the places where they were truck. On the reverie of this coin is delineated a kind of fquare machine floating upon water. 'Through an opening in it are fen two perfons, a man and a woman, as low as the breath; and upon the head of the woman is a veil. Ores this ak is a triangular kind of pediment, on which there fits a dove; and below it another, which feems to flutter its wings, and hold in its mouth a finall branch of a tree. Before the inachine is a man following a woman, who by their attitude fem to have jut gaited it, and to have got upon dry land. Upon the ark itself, underneath the perfons there incloned, is to be read in diftinct characters, N as. The learned editor of this account fays, that it had fallen to his lout to meet with three of there coins. They were of brats, and of the medallion bize. One of them he mentions to have feed in the collection of the Duke of Tufeany ; the Second in that of the Cardionat Ottoboni ; and the third was the property of Auguftinu Chigi, nephew to Pope Alexander VIl."
Aconuts Not content with the fe tuimonies, however, which of the tho d are to be met with in the welters regions, or at leal the met in thole not very far to the cadtward, our author hows with in -luna and $\therefore$ in.
though now current among the Indians, is of great antiquity, as we may learn from the account given of this perlonage by Clemens Alexandrinus. 'There is a catt of Indians (fays he) who are difiples of Buthey are attended, point out the country from whence they originally came. In Cana the deity upon the loos in the mid! of waters has been long a favorite emblem, and was imported from the wat. The in fine of the dragon was from the fame quarter. The Cuthites wormipped Cham, the fun ; whole name they varioully compounded. In China molt things whin have any reference to fplendor and magnificence, feer to be denominated from the fame object. Cham is fad, in the language of that country, to fignify any thing jupreme. Cum is a fine building or palace, firmJar to Coma of the Amonians. Cum is a lord or ma: fer; Cham a feeptre. Laftly, by Cham is fignificd a pries, analogous to the Chamanim and Chamenim of Cutha and Babylonia. The country itlelf is by the Tartars called Ham. The cities Cham-ju, Campion, Compition, Cuman, Chamul, and many others of the fame form, are inanifeltly compounder of the faced term Chan. Cambalu, the name of the ancient metropolis,

tas. This perfon, on account of his extraordinary
fanctity, they look up to as a god.' 'The name of Bon
las, Battus, and Bceotus, though apparently confer
red upon the patriarch, yet originally related to the
machine in which he was preferved. Of this rome
traces may be found among the Greeks. One of the
Amonian names for the ark were Aten and Arene;
and Brootus is raid by Diodorus Siculus to have been
the for of Neptune and Arne, which is a contraction
of arene the ark. The chief city, Boutus in Egypt,
where was the floating temple, dignified properly the
city of the float or ark. The Beootians, who in the
Dionufiaca fo particularly commemorated the ark, were
fuppofed to be defeended from an imaginary perfonage,
Scotus; and from bim likewife their country was
thought to have received its name. But Bootus was
merely a variation from Boutus, and Butns, the ark;
which in ancient times was indifferently Ifyled Sheba,
Argus, Aren, Lutus, and Booths. The term Cibo
tue is a compound of the fame purport, and dignifies
both the temple of the ark and ali a place for thin.
ping.

"All the mysteries of the Gentile world lem to have
been memorials of the deluge, and of the event which
immediately fucceeded. They confined for the mott
part of a melancholy prceefs; and were celebrated
by night in commemoration of the late of darkness
in which the patriarch and his family had been invol
wed. The frt thing at thole awful meetings was to
offer an oath of fecrecy to all who were to be initiated:
after which tixey proceeded to the ceremonies. There
began with a defcription of chaos: by which was fig-

daily the fane as puss, the great abyss. Who, ias two of
Epiphanius, is fo ignorant as not to know, that Chaos the word
and Buthos, the aby s, are of the fame purport?

"The names of the deities in Japan and China, and
the form of them, as well as the mythology with which

$\square$
tropolis, is the city of Cham-bal ; and Milton flyles it very properly Cambaul, feat of Catbaian Chan. By this is meant the chicf city of the Cuthean monarch; for Chan is a derivative of Cahen, a prince. It feems fonctimes in China ald Japan to have been exprefled Quan and Quino.
." Two temples are taken notice by Hemcton, near Syrian in Pegu, which he reverents as to like in thacture, that they femed to be buite on the fane modet. One of thefe was called Kiakiack, or the Good of Gools temple. The other is called the temple of Dorgun; and the doors and windows of it are perpetuatly that, 10 that none can enter but the priths. They will not tell of what fhape the idel is, but ouly fay that it is not of a human form. The lormer deity, Kiakiack, is reprefented as afeep, of a human hape, and 6o fect long; and when he awakes, the world is to be deltroyed. As foon as Kiakiack has diffolved the frame and being of this world, Dugun will gather up the fragments, and make a new one. I make nodoubt but the true name of the temple was fack-Iakh, and dedicated to the fame god as the Jachuli in Japan. Mr Wife takes notice of the Grecian exclamation to Dionufus, when the terms Iacche, O Iache, wete repeated: and he fuppofes, with great probability, that the Peguan name had a reference to the fame deity. It is certain, that the worfhip of Dionufin prevalled very early anong the nations in the eat. The Indians ufed to maintain, that his rites firlt began among them. Profeffor Bayer has fhown, that traces of his worfhip are till to be obferved among the 'lamuli of Tranciuebar. - They have a tradition (fays he), that there was once a gigantic perfon named Fitidit/ /uren, who was born at Nifadabura near the mountain Meru. He had the homs of a bull, and drank wine and made war upon the gods. He was attended by cight Pudam, who wene gigantic and mifchievous damens, of the family of thole Indian thepherds called Koterler.' In this account we have a manifelt reference to the hiftury of Dionuflus, as weil as that of the Dionufians, by whom his rites were introduced. And we may perceive, that it bears a great refemblance to the accounts tranimitted by the Grecians. What are thefe Kobaler, who were defcended from the fhepherds, but the fame as the Cubali of Greece, the uniform attendants upon Dionufus? a fot of priels whofe cruelty and chicanery rendered them in:famous. 'The Cubali (fays an ancient author) were a fet of cruel demons, who followed in the retinue of Dionufus. It is a term made ufe of for knaves and cheats.'
"As the deity, in the fecond temple of Syrian, to which flrangers were not admitted, was not of a human form, and was called Dagun, we may eafily conceive the hidden charafter under which he was deferibed. We may conclude, that it was no other than that mixed figure of a man and a fifh, under which he wat of ohd worlhipped beth in Palettine and Syria. He is expreffed uader this tymbolical reprefentation in many parts of ludia; and, by the bramins is called Wifnue or tijlnow. Dayon and Vifhnou have a like relerence. Thicy equally reprefent the man of the lea called by Berous Chanes; whofe hittory has been reverfed by the Indians. They fuppofe that he will refture the world, when it thall be dellroyed by the chief God. Dut by Dagon is ligaified the very perfon thio'
whom the earth has been already reflored when it was in a tate of ruin; and by whom mankind was renew. ed. Dagon and Noah I lave thown to be the fane Vifhnou is reprefonted, hke Dagon, under the mixed figure of a man and a fifh, or rather of a man, a princely figure, proceeding from a fifh. 'Ihe name of this ditrict, neear which the tomples above dand, we find to be called Surian; juit as was named the tegion where llood the temples of Atargatus and Dagon. Synas, Syria, and Syrian, are all of the fame purport, and fignofy Coleitis and Solaris, fiom Seloor, the lun."

Our author next ploceeds to deferibe fome of the Indian temples or pagodas ; particularly thofe of Salfette, Eliphat.ta, and another called Elora near Alt. rangeabad in the province of Balagate, which was vilited by Thevenot. That traveller relates, that "upos making diligent inquiny among the natives about the origin of thele wonderful buildings, the condtant tra. dition was, that all the fe pagodae, great and fmall, with all their woiks and umaments, were made by giants; but in what age they could not tell."
"Many of thefe ancient Atructures (continues Mr Bryant) have been attributed to Ramfander, or Alexander the Great ; but there is nothing among thefe thately edifices that in the leaft favours of Gtecian workmanithip; nor had that monarch, nor any of the princes after him, opportuaity to perform works of this nature. We have not the leaft reafon to think that they ever poffefferl the country; for they were called off from their attention this way by feuds and engagements nearcr lome. There is no tradition of this country having been ever conquered except by the fabulous armies of Hercules and Dionufus. What has led people to think that thefe works were the operation of Alexatder, is the fimilitude of the name Ramtsander. To this perfon they have fometimes been attributed; but Ramtxander was a deity, the fuppofed fon of Bal; and lic is introduced among the pertonages who were concerned in the incarnations of Vifhnou.
"The temple of Elora, and all the pagodas of which I have nade mention, mult be of great antiquity, as the natives cannot reach their era. They wele undoubtedly the work of the Indo-Cuthites, who came fo early into thefe parts. And that the fe flructures were formed by thein, will appear from many circumHances; but efpecially from works of the fanie magnificence which were performed by them in other places. For farce any people could have effected fuch great works, but a branch of that family which erected the tower in Babylonia, the walls of Balbec, and the pyiamids of Egypt."
Having then defcribed a number of Eaf Indian idole of furpriling magnitude, "the Babylonians and Egyptians (fays he), and all of the fane great family, ukd to take a pleafure in furmiang gigantic higures, and exhibiting oher reprefeatations equally flupendous. Such were the coloflal flatues at Thebes, and the fphiux in the plains of Coume. The flatue erected by Nehuchaduezzar in the phains of Dura, was in height throcfore Babylonith cubits. It was proba-
 was alfo dedicated to the head of the Chaldaic family; who was deified, and reverenced under that title. Marcellinus takes notice of a flatue of Apollo named Coneus; which, in the time of the enperol Verus, wis
b:ought: fame deity as the preceding. We may alfo infer, that the temple at Kamju was erected to Cham the fun, whom the people worhipped under the name of Samoafu."

It is remarlable, that in Japan the priefts and nobility have the title of Cami. The emperor Quebacondono, in a letter to the Portugucfe viceroy, 1585 , tells Sin, that Japan is the kingdom of Chanis; whom, fays he, we hotd to be the lame as Scin, the origin of aid things. By Scin is mobably meant San, the fun: who was the fane as Cham, rendered liere Chanis. The laws of the country are fpoken of as the laws of Chanis; and we are told by Kimpfer, that all the gods were ftyled either Sin or Cani. The founder of the empire is faid to have been Teanfio Dai Sin, or "Tentio the god of light." Near his temple was a cavern religiondy vifited, upon account of his having been once hid when no fun nor itars appeared. He was efteemed the fountain of day, and his temple was called the tompt of Aruizu. Near this cavern was another temple, in which the canuli or pricts flowed an image of the deity finting upon a cow. It was called Dainits No Ray, "the great reprefentation of the fun." One of their principal gods is Jothuf, fimilar to the Jacchus of the Wet. Kxmpfer fays, that he is the Apollo of the lapancle, and they deferibe him as the Egyptians did Orus. His temple ftands in a town called AFimoki: and Jakuli is here reprefented upon a gilt tarate flower; which is faid to be the nymphiea porluffris maxima, or faba Axyptiza of Profper Alpinus. One half of a large fallop thell is like a canopy placed over him; and his head is furrounded with a crown of rays. They have alfo an idul mamed AMen:ppe, much reverenced in different parts. Both thefe, continues our author, relate to the fame perfon, ziz. Noah. Kimpfer, an awhor of great credit, faw the temple of Dabys, which he truly renders Daibot, at Jcdo in Japan. By Dai-Eod was meant the god Budha, whofe religion was fylled the Dudjo, and whieh prevailed greatly uron the Indus and Ganges. Firmpfer, from whom Mr Dryant takes this account, fays, that the people of Sian reprefent him under the form of a Moor, in a litting poiture, and of a prodigious fize. His fkin is black, and his hair curled (probably woolly), and the images about him are of the fame complexion. "This god was fuppofed (fays Mr Bryant) to have neither father nor mother. By $B u d h a^{a}$ we are certainly to undertand the idolatrons fymbol called by fome nations Budlio; the fane as $A$ sins and Theta (names for the ark). In the mytholosy concerning it, we may fee a refercuce both to the machine itiflf and to the perfon preferved in it. In confequence of which we find this perfon alfo ftyled Bocl, Buabu, and Burds; and in the Wred Butur, Batus, and Bootus. He was faid by the Indians not to have been born in the ordinary way, but to have come to light indirectiy throurl the fide of his mother. By Clemens of Alexandria he is called Bomas and in the hiftory of this perfen, however varied, we may perceive a relation to the arkite deity of the fea, called Pofeiton or Neptune; alifo to Arculus and Dionulus, Hyted Babus aind Themnes. Kxnmper has a curions hitory of a deity of this fort called Alotto; whefe semple food in the province of Bungo, upon the faa-
drore, near the village of Toma. About a quarter of a German mile before you come to this sillage ltands a famous tenple of the god Abutto; which is faid to be very eminent for miraculounly cuing many inveterate diftempers, as alfo fur procuring a wind and good paflage. liur this reafon, failors and pafiengers always tie fome farthings to a piece of wood, and throw it into the fea, as an offering to this Abutto, to obtain a favourable wind. The fame deity, but under a different name, was worthipped in Chima. The Apis, Mneuis, and Anubis of Egypt, have often been mentioned and explained as well as the Minotaur of Crete. The fame lieroglyphics occur in Japan; and we are informed by Marco Polo, that the inhabitants worthip idols of difierent thapes. Some have the head of an ox, fome of a fwine, and others the head of a dor. The molt common reprefentation in this country is that of Gollf Ton Ou, or 'the ox-headed prince of heaven.'
"It has aheady been taken notice, that the ark was reprefented under the fymbol of an egg, called the mundone efy ; which was expoled to the rage of 'I'yphon. It was alfo deferibed under the figure of a lunette, and called Solene, the moon. The perfon by whom it was frameal, and who through its ineans was providentially preferved, occurs mader the character of a iteer, and the machine 1 tielf under the femblance of a cow or leifer. Whe lave moreoter been told, that it was called Cilotus, which Clemens of Alexandria calls Thbotion. Epiphanius mentions it by the name of ldeel fowh; and fays that, according to an callern tradition, a perfon naned $A^{\top} u n$ was preferved in it. The horie of Neptune was anotheremblem, as was alfo the hippopotamus or river-horfe. The people of Elis made ufe of the tortoine for the fame purpofe, and reprefented Venus as refting upon its back. Sume traces of thefe hieroglyphics are to be found in Japan, which were certainly carried thither by the Indic Ethiopians.
"From an account of a temple of Daisoth (probably the fame with Daibod) at Meaco in Japan, we riay petceive, that the perple there foeak of the renewal of the world at the deluge as the real creation, which I have fhown to be a conmon milake in the hiftories of this event. And though the itory is told with feme variation, yet in all the circumitances of corferpence it accords very happily with the mythology of Egyt, Syria, and Grecte. It mattes not how the embicins have by length of time been milinterpreted. We hate the mundane cgo upon the waters, and the concomitant fymbol of the moon; and the egy it laft opened by the aflitance of the facred Ateer, upon which the world iflies forth to this day." The author proceeds afterwards to mention the grat vencration paid in thefe parts to the ox and cov; and fays, that nobody dares injure them. One deity of the Japancie was Canon, the reputed lord of the occan. He was reprefented in an erect poture, crowned with a hower, and coming out of the month of a fith. He is roprefented in the tame manner by the natives of Indiz, and named $J^{r}$ thanouand Mracauter; and he is to be found in otleer parts of the Eait. Father Douthet mentions a tradition anong the Indians concerving a flood in the days of Vithnon which covered the whale eartl. It is moreorer reported of him, that feeirg the prevaline
of the waters, he made a foat ; and being turned into a fifh, he feered it with his tail. This jeerfon, in the account of the Banians by Lord, is called Menose; which certainly thould be expreffed AMcn-Now. It is faid, that in the Shater of this people, a like hiftory is given of the earth being overwhelmed by a deluge, in which mankind perifhed; but the world was afterwands renewed in two perfons called Menou and Ceteroupa. Vihnou is deferibed under many charadters, which he is faid at times to have affumed. One of thefe, according to the hramins of Tanjum, was that of Rama Sami. This undoubtedly is the fame as Sama Rama of Paby!onia, only reverfed: and it relates to that geeat phenomenon the Iris; which was generally accompanied with the dove, and held in veneration by the Semarim.
"As the hifory of China is fuppofed to extend upwards to an amazing leight, it may be worth while to confider the firft eras in the Chinefe amnals, as they are reprefented in the writings of Japan: for the Japanele have preferved hittories of Ctina; and hy fuch a collation, I believe no fmall light may be obtained towards the difcovery of fome important truths. Hitherto it has not been obferved that fuch a collation could be made.
"In the hiftories of this country, the firf monareh of China is named Foki; the fame whom the Chinefe call Fohi, and place at the head of their litt. This prince had, according to fome, the body, according to others the head, of a ferpent. If we may believe the Japanefe hiftorians, he began his reign above 21,000 years hefore Chrilt. The fecond Chinefe emperor was Sin-Noo, by the people of China called Sin Num; and many begin the chronology of the country with him. He is fuppofed to have lived about 3000 years hefore Chrift ; confequently there is an interval of near 18,000 years between the firl emperor and the fecond; a circumflance not to be credited. The third, who immediately fueceeded Sin -Noo, was Hoam-Ti. In this account we may, I think, perceive, that the Chinefe have acted like the people of Greece and other regions. The hifories which were imported they have prefixed to the annals of their nation; and adopted the firft perfonages of antiquity, and made them monarchs in their own conntry. Whom can we fuppofe Fohi, with the head of a ferpent, to have been, but the great founder of all kingdoms, the father of mankind? They have placed him at an immenfe difance, not knowing his true era. And I think we may be affured, that under the character of Sin Num and SinNoo we have the hiftory of Noah; and Haam-'Ti was no other than Ham. According to Kxmpfer, SinNoo was exactly the fame character as Scrapis of E gypt. "He was an hufbandman, and taught mankind agricuture, and thofe arts which relate to the immediate fupport of life. He alfo difeovered the virtues of many plants; and he was reprefented with the head of an ox, and fometimes only with two homs. His picture is held in high eftimation by the Chinefe.' Well indeed might Kempfer think, that in Sin-Noo he faw the character of Serapis; for this perfonage was no other than Sar-Apis, the great father of mankind, the fame as Men-Neuas of Egypt, the fame allo as Dionufus and Ofiris. By Du Halde he is called Chin-Nong, and made the next monarch after lohi. The Chincfe
accounts aford the fame hifory as has been given Deluonabove.
"As the family of Noah confiled of eight perfons inclufive, there have been writers who have placed fome of ther in fuceeflion, and frppofed that there were three or fout perfons whon reigned butween SinNoo and Hoam. But Du Whalde fuss, that in the true hiftories of the country, the three fird monarchs were Fohi, Chin-Nong, and Flom, whon he tyles Hoans-Ti. To thefe, he fays, the ante aml feiences owe their invention and progrefs. Thus we find, that thofe who were heads of familics hav been tafol to be princes; and their names have been preased to the lifls of kings, and their hifory fuperadfed to the annals of the country. It is further obfervable, in the accounts given of thofe fuppofed kings, that their term of life, for the lirt tive or hix generations, correfpomes with that of the patriarchs after the food, and decreafes much in the fame proportion.
"The hittory of Japan is divides ${ }^{13}$ which confift of gods, demigods, and murtals. The Cf Japan. perfon whom the natives look upon to be the real founder of their monarchy is named Symm; in whofe reign the Sintoo religion, the molt ancient of the country, was introduced. It was called Sin-siu and Chami-mitfa; from Sin and Chami, the deities which were the objects of worhip. At this time it is faid that bco foreign idols were brought into Japan. To the Sintoo religion was afterwards added the Budfo, together with the worfhip of Armida. This deity they commonly reprefented with the head of a dor, and efteemed him the guardian of mankiad. This religion was more complicated than the former, and abounded with hieroglyphical reprefentations and mytterious rites. It is the fame which I have termed the Arkite Idolutry, wherein the facred fteer and cons were vencrated. The deity was reprefented upon the lotus and upon a tortoife, and eftentimes as procecding from a fifh. In this alfo, under the character of Bodha, we may trice innmerable memosial3 of the ark, and of the perfon fulerved in it. The anthor above, having mentioned the eleventh emperoninclulive from Syi Mu, tells tes, that in his time the fen rites began. 'In his reign Eudo, otherwife ealled Kobotus, came over from the Indies to Japan; and brought with him, upon a whire horfe, his religion and doctrines.' We find here, that the obiect of wor. fhip is made the perfon who introduced to (a mitake almof univerfally prevalent) ; otherwife, in this thore account, what a curious hifory is unfol!ed!
" The only people to whom we can have reconvie for any written memorials concorning the fe things. ate the inhabitants of India Proper. Thoy were, we find, the perfons who intruduced thefe hitrogly phers both in China and Japan. It will therefore be worib while to confider what they have timinitted coneorn. ing their religious opinions; as we may from hence obtain ath greater light towards explaining this fymin bolical worthip. Every manifetation of Gou's gocal. nefs to tede world was in the frit ages expretted by en hiuroglyphic; and the Deity was accordingly deferibed under various forms, and in different attitudes. Thefe at length ware minaken for real trime. figurations; and Vifmou was fuppofed to have apo geated in different haps, which were flyled incornan

## D L $\quad[736] \quad D \cdot E \quad L$

De'uge. tions. In one of thefe he is reprefented under the figure before mentioned, of a princely perfon eoming out of a fifh. In another he appears with the head of a boar, treading upon an evil demon, which feems to be the fame as the Typhon of the Egyptians. On bis head he fupports a lunette, in which are feen cities, towers, in Mort, all that the world contains. In Baldæus we have a delineation and hitory of this incarnation. Kircher varies a little in his reprefentation, yet gives him a fimilar figure of the Deity, and Atyles him Vi/bnou Darabater. By this I hould think was fignibied Vifhnon, "the offspring of the fifh." The bramins fay, that thete was a time when the ferpent with a thoufand heads withdrew itfelf, and would not fupport the world, it was fo overhurdened with fin. Upon this the earth funk in the great abyfs of waters, and mankind and all that heathed perithed. But Vihnou took upon himfelf the form above deferibed, and diving to the bottom of the fea, lifted up the earth out of the waters, and placed it, together with the ferpent of a thoufand heads, upon the back ig of a tortoife.
Accume of "In the third volume of M. Perron's Zendavelta, the cofme there is an account given of the cofmogony of the gory and deluge civen by the Parfees.
was for fome time entirely covered. At laft, the waters retrating within their proper bounds, the mountain of Albordi in Ferakh-kand firll appeared ; which the author compares to a tree, and fuppofes that all other mountains proceeded from it. After this there was a renewal of the world; and the earth was reftored to its prifine ftate. The particular place where Ormifda planted the germina from whence all things were to fpring, was Ferakh-kand; which feems to be the land of Arach; the country opon the Araxes in Amnenia."

Thus we have given an ample fpecimen of this very ingeuious author's method of realoning, and difcovering traces of the facred hiltory even in things which have been thought leatt to relate to it. 'lhat the Greeks and wellem nations had fome knowledge of the food, has never been denied; and from what has been already related, it appears that the fame has pervaded the remotelt regions of the eat. The know ledge which thefe people have of the fall of man, and the evil confequences which enfued, cannot, aceording to our author, be the confequences of their intereourfe with Cluittians; for their traditions afford neither any traces of Chriftianity nor its founder. Whatever truths may be found in their writings, therefore, muit be derived from a more ancient fource. "There are (fays he) in every climate fome fhattered fragments of original hiftury ; fome traces of a primitive and univerfal language: and thefe may be obferved in the names of deities, terms of wormip, and titles of honour, which prevail among nations widely feparated, who for ages had no connection. The like may be fonmd in the names of pagodas and temples; and of fundry other objects which will prefent themfelves to the traveller. Even Ameriea wonld contribute to this purpofe. The more rude the monuments, the more ancient they may poffibly prove, and afford a greater light upon inquiry."

The accounts hitherto met with in this continent, American indeed, are far from being equally authentic and fatis-aceounts of factory with thofe hitherto treated of. In Acalta's the deluge. hitory of the Indies, however, we are informed, that the Nexicans make particular mention of a deluge in their country, by which all men were drowned. According to them, one liracocha came out of the great lake 'liticaca in their country. This perfon ftaid in Tiaguanaco, where at this day are to be feen the ruins of fome aneiont and very ftrange buildings. From thence he came to Cufco, where mankind began to multiply. They fhow alfo a fmall lake, where they fay the fun hid himelf; for which reafon they facrifice largely to him, both men and other animals.Hemnepin informs us, that fome of the favages are of opinion, that a certain Spinit, called Olkon by the Iroquosis, and sidabauia by thofe at the mouth of the river St Laurence, is the Creator of the world; that Moflou repaired it after the dehge. They fay, that this Mefluy or Otkon, being a hatating one day, his dogs loft themfelves in a great late, which the ecupon ovedlowing, covered the whole earth in a fhort time, and fwall wed up the world. According to lierrera, the perople of Crba knew that the deavens and the canth had been created: and faid they had much infounation concerning the flood; and that the world had been deftroyed by water, by three perfons, who

## D E L

Deluge. came three feveral ways. Gabriel de Cabrera was told thy a man of more than 70 years of age, that an ofd man, knowing the deluge was to come, buil: a great hip, and went into it with his family and abundance of animals; that he fent out a crow, which did not at tirit return, flaying to feed on the carcafes of dead animals, but afterwards came back with a green branch. He is faid to have added other particulars nearly confonant to the Mufaic aceumt, as far as Noah's fons cove ing him when drunk, and the other fooffing at it. The Indians, he faid, defcended from the latter, and therciome had no clothes; but the Spaniards defending from the former, had both chothes and horfes. - The fanc author likewife informs us, that it was reported by the inhebitants of Cartilld del $\mathrm{O}_{10}$ in Tera lima, that when the univerfal deluge happened, one man wih his wife and children efcaped in a canoe, and that from them the world was peopled. The Penvians, according to our anther, likewife affimed, that they had receised by tradition from their ancellore, that, many years before thene wele any incas or kings, when the country was very populuus, there happened a great flood; the fca breaking out hegond its bounds, fo that the land was coverd with water, and all the people perihed. To this it is added by the Gumeas, inhabiting the vale of Xaufea, and the natives of Chicquito in the province of Callao, that fome perfuns renained in the tollows and caves of the highel mountains, who arain peopled the land. Others afirm, that all perithed in a deluge, only fix perfuns liciag faved in a float, from whom defended all the inhabitants of that country. In Neuhoff's voyages to Bratil, we are informed, that the moll harbarous of the Prafilians, inlabiting the inland comatrics, farce knew any thing of religion ar an Almighy leing: they have fome knowledge remaining of a general eleluge ; it being the ir opinion that the whole race of matikind were extirpated by a general deluge, except one man and his filter, who, being with child before, they by degrees repeophd the world. N. Thevet gives us the creed of the BraShians in this matter more particularly. In the opinion of thefe favages, the deluge was univerful. They fay, that Sommay, a Cariblece of great dignity, had two children named Tamendonare and Ariconle. Being of contrary difpofitions, one delighting in peace and the other in war and rapine, they mortally hatcd each other. One day Ariconte, the warrior, brought an arm of an enemy he had encountered to his, brother, reproaching lim at the fame time with cowardice. The ether retorted by telling, that if he iad be er pofeted of the valour the hoathel, lie would have brought his encony cotire. Aricunte on this threw the arm againt the done of his brother's loove. At that inflant the whole village was carried up into the Dky, and Tamendonare Itrihing the ground with viulence, a valt floam of water iffued out from it, and continued to how in duch qquantity, that in a fhort time it feened to rife above the clouds, and the earth was entirely corcred. the two bruthers, feeing this, afcended the highett mountains of the country, and with thair wives got upon the trees that grew upun then. By this deluge all mankind, as will as ail other ammals, were drowned, cocept the two brothers above mentioned and their wives; who having deffended when the flood abated, became heads of tyu dificrent nations," sec.

Vos. V. Pare. II.
7.37 D I B

To thefe Ancrican teftimonics we may autamother from the remote and ancivilized itand on Utaheite. Dr Wationt, in his difourle to the shergy, infome us, that one of the navigators to the fouthern hemifphere having afked fome of the inhabitants of that o.sfonto illand concerning thei ongion, was anfwerd, that anthe bet: their fupreme God, a long time ago, beine angry, $t$ som.
 heing bruken off, was preferved. In the Eat Indiesp. $2 c 9$. alfo we are iufurmed by Lor Wat fonf, that Sir Willian iond. Jones, by whom a lucicty fire the duancoment of A. P. 22t. fiatic literature has been inllituted at Calcutta, has difcoveted, that in the oldef mythelogical bouks of that comutry, there is fuch an acount of the deluge as correfponds fufficiently with that of Mofc .
II. The fact being thus eftablithed by the univerfal ityputher, confent of mankind, that there was a general deluge concernicg which overflowed the whole world; it remain* next the means to inguire, by what means it may reafonably be fup- the delure pofed to have been accomplithed. The hypotheris tuok phace on this fubject have been principally the following.
23.

1. It has been afferted, that a quantity of water sumpucs was created on purpofe, and at a proper time annihi-creation latel, by divine power. This, lowever, befides its and an lan being abfulutly without cridence, is directly contrary wates. to the words of the facred writer whom the afferters of this bypothelis mean to defend. He exprefsly derives the waters of the flood from two fources; tirfo. the fountains of the great deep, which he tells us were all broken up; and fecondly, the windows of heaven, which he fays wer: opened: and fpeaking of the decreafe of the waters, he fays, the fountains of the deep and the windows of heaven were flopped, and the waters reiurned continually from off the earth. Here it is obviens, that Mofes was fo far from laving any diffeculty ahout the quantity of water, that he thought the fouress foom whence it came were not exhanted; fince both of them required to be itopped by the fame almighty land who opened then, tett the flood frould increale more than it actually did.
2. Wr Burnct, in his Tiluris Theor:s Suca, endea-Thco.y ue vours to flow, thin all the waters in the ocean ave Dr bunnes not fufficien to corer the carth to the depth anigned by Mofes. Suppoling the fea drained quite dry, and all the clouds of the atmofphere diffolved into rain. we fould ftill, according to him, want mach the greateft part of the water of a deluge. To get clear of this dificuity, Ur Burnet and others have adopted Defeartes's theory. 'That phulotupher will have the antediluvian world to have been perfectly round and equal, without mountains or valleys. Ife accounts for its formation on mechanical piniciples, by fuppofing it at tha in the condition of a thick turbid hud replete with divens izeterogeneuns matters; which, fulfeding by flow degrees, formed themfelves into different concentric thata, or beds, by the laws of gravity. De Burnet intruves on this theory, by fuppotine the prinitive easth to have been no more than a fhell or cruf invelling the furface of the wattr contained in the ocean, and in the centrat abyis which he and (1thers fuppoie to exitt in the bowels of the eath. * At - Sce Aby... the tine of the floud, this outward crutt, aecording to him, broke in a thoufand places; and carfequently funk down among the water, which thrs fyonted up in vatt cataracts, and overtlowed the whole finface. He fiepofes who, that before the fluod there was a 5 A perfut

## D E L

De'uge. perfeet coincidence of the equator with the echiptic, and confequenly that the antediluvian world enjoyed a perpetual foring ; but that the violence of the thock by which the outer cruft was broken, fhifted alfo the polition of the earth, and produced the prefent oblioury of the echiptic. "This theury, it will be obferved, is equally arbitrary with the former. But it is, befides, directly contrary to the words of Mofes, who affurs us, that all the high hills were covered; while Dr Burnet affirms that there were then no hills in be-
25
Dentre of
gravity of the earth
fap rofed ${ }^{0}$
be fhiftes.

25

## Mr Whi-

fron's theory.
as an hypothefis ; but, on further confideration, Mr Whiton thought he could actually prove that a comet did at that time pafs very near the earth, and that it was the fame which afterwards appeared in 1680 . After this, he looked upon his theory no longer as an hyputhelis, but publifhed it in a particular tract, en titled, The Caufe of the Dehuge tiemonflated. But the uncertainty of the comet's return in 1758, and the abfolute failure of that which ought to have appeared in 1, 88 or 1780, nuff certainly render Mr Whifton's calculations for fuch a length of time extremely dubious; and the great fimilarity between the tails of comets and flreams of clectric matter renders his fuppolition of their being aqueous sapours exceedingly improbable.
5. A-ccording to Mr de la Pryme, the antediluvian Then ${ }^{27}$ world had an external fea as well as land, with moun- Mr de la tains, rivers, \&c. and the deluge was effected by break- Pryme. ing the fubtermaeous caverns, and pillars thereof, with dreadful earthquakes, and canfug the fame to be for the moft part, if not wholly, abforbed and fiwallowed up, and covercd by the feas that we now have. Lattly, this eartl of ours arofe out of the bottom of the autcdiluvian fea; and in its room, jult as many iflands are fwallowed down, and others thruft up in their ftead. On this, as on all the other hypothefes, it may be remarkcd, that it is quite arbitrary, and withont the lealt foundation from the words of Mofes. The facred hiftorian Speaks not one word of earthquakes, nay, from the nature of the thing, we know it is impoffible that the flood could have been occafoned by an earthquake, and the ark preferved, without a miracle. It is certain, that if a hip finks at fea, the commotion excited in the water by the defeent of fuch a large body, will fwallow up a fmall boat that happens to come too near. If the pillars of the eath itfelf then were broken, what muft the commotion have been, when the continents of Europe, Afia, and Africa, defcended into the abyfs at once? not to mention America, which lying at fo great a diftance from Noah, he might be fuppoided out of danger from that quarter. By what miracle was the little ark preferved amidt the tumult of thofe impctuons waves which mult have rufhed in from all quarters? Beflies, as the ark was built not at fea, but on dry ground; when the earth on which it refed funk down, the ark malt have funk along with it ; and the waters falling in as it were overhead, mult have dafhed in pieces the ftrongelt veflel that can be imagined. Eartlquakes, allo, operate fiddenly and viokently; whereas, according to the Moliaic account, the flood came on gradually, and did not arrive at its height till fix weeks, or perhaps tive months, after it began.
6. Mr Hutchinfon and his followers prefent us with Hutchinfe a theory of the deluge, which they pretend to derive nian theofrom the word of God itfelf. This theory hath been ry. particularly enlarged upon and illultrated by Mr Catcot, who in 1768 pubrithed a volume on the fubject. This gentleman afferts, that when the world was linet created, at the time when it is faid to have been " without form and void," the terreltrial matter was then entirdy diffolved in the aqueons; fo that the whole formed, as it were, a thick muddy water. The figure of this mafs was fpherical; and on the outfide of this Splere lay the grois dark air. Within the fphere of earth and water was as immenfe cavity, called by Mc. fes the reps; and this intermal cavity was filled with air of a kind fimilar to that on the outide. On the creation of light, the internal air received clatticity fuflicient to burt ont through the external covering of earth and water. Upon this the water defended, filled up the void, and left the earth in a form limilar to what it hath at prefent. Thus, according to him, the antediluvian worlch, as well as the prefent, confilted of a valt collection or maclens of water, called the great decf, or the alyf ; and over this the thell of earth perforated in many places; by which means the waters of the ocean commmicated with the abyfs. The breaking up of thefe fountains was occalioned by a miraculons preffure of the atmotphere, from the immediate action of the Deity limifli. So violent was this prefilue, that the air defcended to where it had been oniginall: ; vecupied the frace of the aby $\mathrm{f}_{\mathrm{s}}$; and drove out the waters over the whole face of the diry land. But this eccount, fo far from being infallioly certain, fecms inconfittent with the moit common obfervations. No prefline, however violent, will caule water ific above its level, molets that preftine is moequal. If, therefore, the atmophere entered into the fuppofed abyfs, by a vehement pretfure on the funface of the ocean, that prefine mult only have been on one place, or on a few places: and even though we fuppofe the atmofphere to have been the agent made ufe of, it is impolfible that it could have remained for any time in the abyfs without a continued miracle; as the preffure of the water would immediately have forced it up again through thofe holes which had afforded it a paffage downwards.

The explication given from Hutchinfon by Mr Catcot, of the " windows of heaven," is fomewhat extraordinaty. According to him, thefe windows are not in heaven, hut in the bowels of the earth; and mean no more than the cracks and fiffures by which the airs, as he calls them, found a paffage through the fhell or covering of earth, whieh they utterly diffolved and reduced to its original fate of fluidity. It is, however, difficult to conceive how the opening of fuch windows as thefe could caufe a violent rain for 40 days and nights.

It is not to be fuppofed, that we can pretend to afcertain any thing on the fubject more than others have done. The following conjectures, however, may be offered on the manner in which the deluge miglit have happened without any violence to the eftablifhed laws of nature.

1. If we confider the quantity of water requifite for the purpofe of the deluge, it will not appear fo very extraordinary as has been commonly reprefented. The height of the highelt hills is thought not to be quite four miles. It will therefore be deemed a fufficient allowance, when we fuppofe the waters of the deluge to have been four miles deep on the furface of the ground. Now it is certain, that water, or any other matter, when fpread out at large upon the ground, feems to occupy an immenfe face in comparifon of what it does when contained in a cubical veffel, or when packed together in a cubical form. Suppofe we wanted to overflow a room i 6 feet every way, or containing 256 fquare feet, with water, to the height of one foot, it may be nearly done by a cubical veflel of fix feet filled with water. A cube of eight feet will
cover it too fict deep, and a cube of ten fect will very nearly cover it four feet deep. It makes not the leaft difference whether we fuppofe fect or miles to be covered. A cube of ten miles of water wokld very nearly overflow 256 fquare miles of piain ground to the lucight of four miles. But if we take into our accomut the vat number of eminenees with which the furface of the earth abounds, the above-mentioned quantity of water would do a great deal more. If, therefore, we atterapt to calculate the quantity of wate fufficient to deluge the earth, we muit rake a very condiderathe allowance for the bulk of all the lills on its furface. Tos condider this matter, however, in its utmoft latitude: The furface of the earth is luppoled, by the latelt computations, to contain $199,512,595$ fquare miles. To overnow this furface to the height of four miles, is reguired a parallelopiped of water 16 miles deep, and containing $49,578,148$ fquare miles of furface. Now, contidering the immente thicknefs of the globe of the eath, it can by no means be inproballe, that this whole quantity of water may be contained in its bowels, without the neceffity of any remarkable abyls or huge collection of water, fuch as moft of our theorits firppofe to exift in the centre. It is certain, that is far as the earth has been dug, it hath been found not dry, but moilt ; nor have we the leait reafon to imagine, that it is not at leaft equally moilt all the way down to the centre. How moitt it really is cannot be known, nor the quantity of water requifite to impart to it the degree of moifture it has; but we are fure it mutt be immenfe. 'The earth is computed to be near 8000 miles in diameter. The ocean is of an unfathomable deptly; but there is no reafon for fuppoling it more than a few, miles. To make all reafunable allowances, however, we thall fuppofe the whole forid matter in the globe to be only equal to a cube of 5000 miles; and even on this fuppofition we hall find, that all the waters of the deluge would not be half furficient to moifen it. The above mentioned parallelopiped of water would indeed eontain $798,050,363$ cubic miles of that fluid; but the cube of earth containing no leis than an hundred and twentyfive thoufand millions of cubic miles, it is evident that the quantity adligned for the deluge would fearce be known to moilten it. It could have indeed no more effect this way, than a fingle pound of water could have upon 150 times its bulk of dry earth. We are perfuaded thercfore, that any perfon who will try by experiment how much water a given quantity of earth contains, awd from that experiment will make calculations with regard to the whole quantity of water contained in the bowels of the earth, mutt be abundantly fatistied, that though all the water of the deluge had been thence derived, the diminution of the general flore would, comparatively feaking, have bein next to nothing.
2. It was not from the bowels of the earth only that the waters were difcharged, but alfo from the air; for we are allured by Mofes, that it rained 40 days and 40 nights. This fource of the deluvian waters liath been conidered as of fmall confequence by almoft every one who hath treated on the fubject. The general opinion concerming this matter we thatl tranferibe from the Univerfal Hiftory, Vol. I. where it is very fully exprefsed. "According to the obfervations made of the

## D E L

Deluge. quantity of water that falls in rain, the rains could not afford one ocean, nor half an ocean, and would be a wry inconfiderable part of what was neceffary for a deluge. If it rained to days and 40 nights throughout the whole carth at once, it might be fuffecient to lay all the lower grounds under water, but it would fignify very little as to the overfowing of the mountains; fo that it has been faid, that if the deluge had been made by rains only, there would have needed not 40 days, but 40 years, to lave brought it to pafs. And if we fuppofe the whole atmorphere condenfed in(1) water, it would not all have been fulficient for this effeet; fur it is certain that it could not have rifen above 32 feet, the height to which water can be raifed by the preflure of the atmofphere: for the weight of the whole air, when condenfed into water, can be no more than equal to its weight in its uatural atate, and mut become no lefs than 800 times denfer ; for that is the difference between the weight of the luavielt air and that of water."

On this fubject we muft obferve, that there is a very gencral millake with regard to the air, fimilar to the above-mentioned one regarding the earth. Becanfe the tarth below our fect appears to our fenfes firm and com. pact, therefore thee valt quantity of water, contained even in the moft folid parts of it, and which will readily appear on proper experiment, is overlooked, and treated as a non-entity. In like manner, becaufe the atir does not always deluge with exceflive rains, it is alfo imagined that it contains but very little water. Becaufe the preflure of the air is able to raife only 32 feet of water on the furface of the earth, it is therefore fuppofod we may know to what depth the atmofphere could deluge the earth if it was to let fall the whole water contained in it. But daily oblervations how, that the preffure of the atmoffhere hath not the leaft connection with the quantity of water it contains. Nay, if there is any commection, the air feems to be lighteft when it contains mot water. In the courfe of a long fummer's drought, for inltance, the mercury in the barometer will ftand at 30 inches, or little more. If it dues fo at the beginning of the drought, it ought to afcend continually during the time the dry weather continnes; becaufe the air is all the while abforbing water in great quantity from the furface of the earth and fea. This, however, is known to be contrary to fact. At fuch times the mercury does not afcend, but rersains ftationary; and what is ftill more extraordinary, when the drought is about to have an end, the air, while it yet contains the whole quantity of water it abforbed, and hath not difcharged one fingle drop, becomes fuedenly lighter, and the mencury will perhaps fink an inch before any rain falls. The moft lurprifing phenomenon, however, is yet to come. After the atmofphere has been difeharging for a number of days fucceffively a quantity of matter 800 times heavier than itfelf, inftead of being liglitened by the difcharge, it becomes beavier, nay foecifically heavier, than it was before. It is alfo certain, that very dry air, provided it is not at the fame time very hot, is alway's heavieft; and the drieft air which we are acquainted with, namely Dr Prieftley's dephlogificated air, isconfiderably heavier than the air we commonly breathe. For thefe reafons we think the quantity of water contained in the whole atmofphere ought to be confidered
as indefinite, efrecially as we lanow that by whatever agent it is fulpended, that agent mull counteract the force of gravity, oitcrwite the water would imenediately defcend; and while the foree of gravity in any fubflance is connteractul, that fublance cannot appar to us to gravitate at all.
3. The above confuderations render it probable at lalt, that there is in nature a quantity of water fufficient to doluge the world, provided it was applied to the purpofe. We mult next confider whether there is any natural agent powerful enough to eficetuate this purpore. We thall take the phrafes uicd by Mule in their mon obvious fente. 'The breaking up of the fontains of the chep we may reafonably fuppofe to have been the upening of all the paffages, whether fmall or great, through which the fubteraneous waters poffibly could difcharge themfelves on the furface of the earth. The opening of the onindows of beaven we may alfo fuppofe to be the pouring out the water contaned in the atmofphere thro' thofe invifible paffages by which it enters in luch a manner as totally to elude every one of our fenfes, as when water is abforbed by the air in evaporation. As both thefe are faid to have been opened at the fame time, it leems from thence probable, that one natural agent was employed to do both. Now it is certain, that the induftry of modern inquirers hath difcovered an agent unknown to ilie former ages, and whofe inflence is fo great, that with regard to this work it may be faid to have a kind of omnipotence. The agent we mean is electricity. It is certain, that, by means of it, immenfe quantitics of water can be raifed to a great height in the air. This is proved by the phenomena of water-fpouts. Mr Forfter relates, that he happened to fee one break very near him, and obferved a flath of lightuing procced from it at the moment of its breaking. The conchution from this is obvious. Whea the clectric matter was difcharged from the water, it could no longer be fupported by the atmofphere, but immediately fell down. 'I'hough water-fpouts do nut often appear in this country, jet every one muft have made an obfervation fomewhat fimilar to Mr Fortter's. In a violent ftorm of thuuder and 1 ain, after every flafh of lightning or difeharge of electricity from the clouds, the rain pours down with increafed violence; thus howing, that the cloud, having parted with fo much of its eluctricity, cannot longer be fupperted in the form of vapour, but mult defeend in ain. It is not indeed yet difcovered that electricity is the caufe of the fufpention of water in the atmofphere ; but it is certain that cvaporation is promoted by clectrifying the fluid to be evaporated *. It may ther fore be admitted as a pofio * See Etec. lility, that the electric fluid contained in the air is the tricty and agent by which it is enabled to fufpend the water Euporawhich riks in vapour. If therefore the air is deprived tion. of the due propontion of this fluid, it is evident that rain muft fall in prodigions quantities.

Again, we are aifured from the molt undeniable obfervations, that electricity is able to fwell water on the furface of the earth. This we can make it dueven in our tritting experiments; and much more muft the whole force of the fluid be fuppofed capable of doiug it, if applied to the waters of the ocean, or any others. The agitation of the fea in earthquakes is a fufticient proof of this $\dagger$. It is certain, that at thefe times there is a difebarge of a val quantity of electric matter from +Sec Eurth
the
meluge. the earth into the air ; and as foon as this happens, all becomes quiet on the furface of the carth.

From a multitude of obfervations it alfo appeare, that there is at all times a paffage of electric matter from the atmorfuere into the sath, and vice werg from the earth into the atmofetere. There is therefore no atbfurdity in fuppofing the Deity to have influenced the action of the natural powers in fuch a manner that for fo days and nights the electric matter contained in the atmosplere flould defoend into the bowels of the earth; - if inded there is occalion for fuppofong any fuch immediate influence at all, fince it is not impolfibe that there might have been, from fome nattural cadie, a defeent of this mater from the atmofphere for that time. But by whatever caufe the dedecut was oceutionch, the confecquence would be, the braking iop of the fromuturs of the dap, and the opening the wimlows of beaven. Tlic water contained in the atmofphere being left withont fupport, would defcend in inpetuons rains; while the waters of the ocean, thole from which fombains onginate, and thofe contained in the folid eath itfelf, would rife from the very centre, and niect the waters whith defeended foom above. 'Thus the breaking up of the fountains of the dece, and the opening tice wiadows of batven, would accumpany each other, as Mofes tells us they actually did; for, according to him, both happened on the fill - day.

In this manner the flood would come on quictly and gradually, without that violence to the grobe which Burnet, Whison, and other theorills, are obliged to fuppofe. The abutement of the waters would enfue on the afeent of the electric fluid to where it was before. The atmofithere woold then abforb the water as formerty; that which had afcended through the cartu would again furfide; and thus every thing would return to its prilline flate.
III. Having thas fown in what manner it is poffible that an univerfal deluge might take place by means of the natural agents known to us at prefent, we fhall next confider fome more of the evidences that fuch an event actually dici happen, and that the deluge was univerfal. The prouf here is fo flrong from the traditions prevalent among almofl every nation on the face of the earth, and which have been already fo amply treated, thar no farther objection could be made to the Mofaic account, were it not that the mecfity of an univerfal deluge is denied by fome, who contend that all the deluges mentioned in hiftury or recorded by tradition were only partial, and may be accounted for from the fwelling of rivers or other accidental canfes. Many indeed, even of thofe who protefs to believe the Mofaic account, have thought that the deluge was not univerfal ; or, thougl: it night be univerfal with refpect to mankind, that it was not fo with regard to the earth itfelf. The learned Ifaac Voffius was of this opinion, thougla his reafens feem priacipally to have been that he cond not conceive how an univerfal deluge could happen. "'o cficet this (fitys he) many miracles mull have concurred ; but God woris no maraches in wain. What need was there to down thofe linds where no men lived, or are yet to be fround? 'Tis a foolith thing to think that nankind had multiplied fo much before the foond as to have crerfpoed all the earth. How fiow and gaggith
the firt men were in propagating their kinci is evnient from hence, that Nuah was bat the ninth in a lineal defeent from Adma. "F"bcy are quite wide of the truth, therefore, who think mankind whave foread over all the earth in the days of $N$ oah, who perlmps at that time had not catented thensmes beyond the borders of Syria and Mefopotamia: lut no reaton obligeth us to extend the inundation of the deluge bejond thofe bounds which were inhabited; yea, it is altogether absurd to aner, that the edeet of a punithment inflited upon mankind only, houhd extend to thofe places where no men lived. Although we thond therefore believe that part of the earth only tos have been owerflowed by the waters which we have mentioned, and which is not the humdredth part of the terreftrial globe, the deluge will neverthelefs be anizarfell, acmenion, finee the deflruction was miverfal, and overwhelmed the whole habitable woll."

Another felueme of a partial dehuge is publifhed by Coen Mr Coctlogon in his Uuiverfal Hittory of Arts and Sciences, under the article Antediluriuns. This appears to have been formed with a delign to accommodate the belief of a deluge to the opinions of the freethinkers, who deny the truth of the Mofaic aceounts, as he tells us that they are willing to allow it. Aceurding to this author, the firf inhabitants of the eartli being placed at the confluence of two great rivers, the Euplrates and Tigris, thofe rivers may have overfowed their banks all of a fudden, and furprifed the neighbouring inhabitants not yee accultomed to fuch fort of vilies, and drowned part of them (and if really defigned as a punithment), fuch as were more guilty. That fome of the animals, particularly the more hothful, and confequently not fo apprehenlive of danger or fo ready to take to flight to avoid it, might have been involved in the fame calamity, is well as fome of the zolatiles, which being deprived of food by the earth's being covered with water, might have perifhed; particularly thofe who, by the wo great weaknef's of their wings to. fupport their bodies, were not proper for a long flight. As for others who lad thefe advantages above the reft, they would no doube take care of their own prefervation by flying to thofe parts of the earth which their natural inftinct could thow them free from the inundation.

A third feheme of a partial deluge is given by the learned bithop. Stimingfleet in his Origines Sacre. "I cannot (Gays he) fee any urgent mereflity from the feripture to affert, that the food did furead itfelf all over the furface of the earth. That all mankind (thofe in the ark excepted) were deftroyed by it, is moll certain aecording to the fciptures. When the Lord faid, that he would deflroy man from the face of the eath, it couk not be any panticular deluse of fo fmall a country as lakeline, as fome have ridiculonaly imagined; for we find an univerfal cormption in the earth mentioned as the caufe; an univerdal threatening upon all men for this caule; and afterwards an univerfal dettruction expreffed as the effect of this food. So then it is evident, that the floud was miverfill with regard to mankind; but foom thence follows mo neveffity at all of alferting the miverfality of it as to the globe of the earth, tukes it be futheiently proved that the whole eath uas peopled hefore the flood, whick. I def fair of serer lesing proved:

## D E I

 yond the oecalon of it, which was the corruption of mankiud?-The only probability then of afferting the univerfality of the food, as to the globe of the earth, is from the deltruction of all living creatures, together with man. Now though men might not have fpead themfelycs over the whole furface of the earth, yet beats and creeping things might, which were all deftroyed with the flood; for it is faid, 'that all flefh died that moved upon the earth, buth of fowl and of cattle, and of every creeping thing that creepeth upon the earth, and every man, To what end hould there be not only a note of univerfality added, but fuch a partieular enumeration of the feveral kinds of beads, creeping things and fowls, if they were not all dellroyed? 'ro this indwer; I armot that, as far as the food extended, all thefe were deltoyed: but I fice no renfon to extend the deltruction of the le beyond that compars and fpace of the earth where men intrabited, becaufe the punithment upon the beafts was occafroned by, and could not but be concomitant with, the deftruction of man; but (the occalion of the deluge being the fin of man, who was punihed in the beaths that were deltroyed for his fake, as well as in himfelf) where the occafion was not, as where there were animals and no men, there feems no neceffity of extending the flood thither.-- But to what end, will it therefore be replied, did God command Noah, with fo nuch care, to take all kinds of birds, beafts, and creeping things, into the ark with him, if all thofe living creatures were not deftroyed by the flood? I anfwer, becaufe all thofe things were dettroyed wherever the flood was. Suppofe then the whole continent of Alia was peopled before the flood, which is as much as in reafon we may fuppofe ; I fay, all the living creatures in that contiment were deftroyed; or if we may fuppofe it to have extended over our whole continent of the ancient known world, what reafon would there be, that in the oppolite part of the globe, which we fuppofe to be unpoopled then, all the living creatures thould there be dedtroyed, becaufe men had finned in this? and would there not have been on this fuppofition a fufficient reafon to preferve living creatures in the ark for future propagation," \&c.?Thus we have the Itrength of all the arguments that have been offered in fupport of a partial deluge, and which may all be lummed up in the three following articles, I. The impoffibility, in a natural way, of accounting for the quantity of water neceffary to overflow the whole world; 2. The fmall number of mankind fuppofed it that time to have exilted on the earth; and, 3. The inntility of an univerfal delinge, when the divine purpofes could have been equally well anfwered by a partial one. But to all this we may make one gemeral anfwer, that a partial deluge is in the nature of things impoffible. We camnot imagine that the waters could accumulate upon any country without going off to the fea, while the latter retained its wfual level; neither can we fuppofe any part of the fea to remain above the level of the reft. On the fuppofition of bifhop Stilling fleet therefore, that the deluge exended over the whole continent of A fia, we know that it mult have covered the bigh mountains of Ararat, on which the ark relted; Caucafus, Taurus, \&e. 'The height of Ararat is in-
determined, as no traveller of any credit pretends to have afcended to its top; but from the diftance at which it is feen, we can fearee look upon it to be inferior to the molt celebrated mountains of the old continent*. Sir John Cha din thinks that fome part * See Arsof Caucafus is higher; and fuppofing each of thefe to rat.
be only a mile and an half in height, the fea all round the globe mult have been raifed to the fame height; and therefore all that could remain of dry ground as a fhelter to animals of any kind, muth have been the uninhabitable tops of lome high mountains fcattered at immenfe diftances from one another. We may therefore with equal reaion fuppofe, that thefe were in like manner covered, and that no living creature whatever could find thelter even for a moment : and it is certainly more agreeable to the character of the Deity to beheve, that he would at onee deltroy animal life by futtocation in water, rather than allow numbers of them to collect themfives on the tops of mountains to perilh with hunger and cold. It is befides very improbable, that any creature, whether bird or beath, could fultain a continued rain of 40 days and 40 nights, even without fuppoling them to have been abfolutely immerfed in water.

This conlideration alone is fufficient to fhow, that if there was a deluge at all, it mult have been universal with regard to the world as well as the human race; and the polibility of fuch a deluge by natural means has aheady been evinced. Under the article Antediluvians it is thown, that, according to the mof moderate computations, the world malt have been vally more full of people than at prefent. 'I'he lealt calculation there made indeed feems incredible ; fince, according to it, the world mult have contained upwards of 63,759 times as many inhabitants as are at prefent to be met with in the empire of China, the moft populous country in the world: but China bears a much larger proportion to the habitable part of the world than this. The violences exercifed by mankind upon one another, have always been the means of thinning their numbers, and preventing the earth from being overfocked with inhabitants; and the ftrong expreffion in Scripture, that the "earth was filled with violence," fhows that it muit have gone to an extraordinary height. But though this violence munt have undoubtedly thinned the old world of its inhabitants, it mutt likewife have difperfed fome of them into dittant regions. There is therefore no reafon for fuppofing, that before the flood the human race were not driven into the remotelt regions of the habitable world, or that America was dettitnte of inhabitants then more than it is at prelent. At any rate, the fchemes of Voffius and Coetlogon, whi would confine the whole race of mankind to a fmall part of Afia, molt appear evidently futile and erroneous in the highelt degice.

Some objections have been made to the doctrine of Objection an univerlal deluge from the fate of the continent of from fome America, and the number of animals peculiar to that fpecies of and other countries, which could not be fuppofed to aninals betravel to fuch a diftance either to or from the ark of to certain Noah. On this fubject Bifhop Stillingfleet obferves, councrie. that the fuppofition of animals being propagated much farther in the world than mankind before the flood, feems very probable, " becaufe the production of animals is parallel in Gencfis with that of fithes, and both

## D E L $[743$ ] D E

Deluge. of them different from man. For Gud faith, Let
the watcrs bring forth every moving creature that hath life, wiz. filh and fowl: And accordingly it is faid, that the waters brought forth abundanty cevery living creature after their kind, and every fowl atter his kinc. Accordingly, in the production of healts, we read, - Let the carth bring forth the living cieature after his kind, cattle, and every creeping thing, and beat of the earth, after his kind: and it was fo.' But in the production of man it is faid, ' Let us make man in our inage, and after our likenefs.' From hence I obferve this difference between the formation of animals and of man, that in one God gave a prolific power to the earth and waters for the production of the feveral hiving creatures which came from than, fo that the fominal principles of them were contained in the matter ont of which they were produced; which was otherwife in nam, who was made by a peculiar hand of the great Cicator himfelf, who thence is faid to have formed man ont of the doit of the ground.
"If now this feppotition be cmbraced, by it we prefently dear owiducs of many difficulties conecroing the propagation of animals in the work, and their conferration in the ark; as bow the unknown kind of ferpents in Crazil, the dow-bellied ereature in the Indies, and all thefe thrange fpecies of animals feen in the Wefl Indits, fould cither come into the arl: of Nodh, or be conveyed out of it into thofe countries which are divided by fo valt an ocean on one fide, and at leath fo, layge a tract of tand on the other. Befides, fone kind of animals cannot live out of the climate wherein they are; and there are many forts of animals difeovered in America and the adjoining inlands, which hase left no remainders of tliemfelves in thefe parts of the world. And it fenss very ltrange, that the fe ihould propagate into thofe parts of the world from the place of the hood, and leave none at all of their number behind them in there parts whence they were propagated."

To this Mr Cockburn, in his treatife on the deluge, replies, I. 'That as it pleafed God to create only ore man and one woman at the begianing, and their poflerity were fufficient to overfpread the earth, it might well be fuppofed to be furninted with animals from an original pair of each. 2. On the fuppoftion of many paiis of brute animals having been created originally, they mul, whea the human race were few in number, have nultiplied to fuch a degree as to 1 ender the world uninhahitable. In conlimation of this, he informs as from the accounts of the Ludian miffonaries, that in the kingedom of Champua in the Indies, the river called by the natives Tinacoreh, but by the Portugucfe Varella, goes up so leagues into the country to a momitain called Moncalor, above which it is nuch broader, but not fo decp by far; there being banks of fand in fome places, and lands ovoflowed with water, whene there are an infinite number of fowls that cover all the conrtry; infomuch, that by reafon of them the whode kingdom of Chintaleuhos had for 40 years been defolate, though it was eight days journey in length; which, at 30 miles a-day, made it 240 miles long. After paffing this country, another was met with more wild, and full of great rocks; where there were a valt number of animals yet worfe than the fowls, as elephants, thinocerofes, lions, bears, buffaloes, and other beafts in fuch multitudes, that whatever men cultivated for the fup-
port of life was fpoiled or detroyed by them, nor was it pullible for the inhabitants to prevent it.

The lhe of France may be fiid to be the kingdom of rats. They cone down from the mountains like an army, creep up the tecepell rocks, march into the flat coutuy, affomble in the marthy gromeds, and bing delolation every where, efpecially in the night. Men can fearee flece for them, and are obliged to rull themfelves in fued things as may befl fecure them from their bitings. It was the fame in the Ine of Bouthon, which was as much infeited with them at lieft, till it became inore fully peopled. "We hane grood reafon therefore (fays Mr Cocklum) to conclate, that there was bat oale pair of ammals created at firth, that they might not increafe too falt for mankind; and thoagh they would multiply much more, and incteaf: faller than men could do, they had room to firead themfityes for a long time without mach anoyance to man; and as men inctealid in number and extended thair habiations, they would be able to drive them father mif, or defend thenifeleses from their depredativas." That lame made of reafoning is by our anthor mathe ufe of with regard to aquatic animals. The multitude of thefe indecd, however great, could be no detiment to man who lived on land; but if we conlider how large and numerous a fpawn tifhes call at once, and in how thort a time they multiply to imant wle numbers, he thinks it reafonable to conclude, that only one pair was created at once; and that the command to the waters to bring forth abunduntly both filh and fowl, related only to the variety of fpecies, not to a number of each.
3. Though at the refloration of the world it was to Tant inbe repeopled by fix perfons inflead of two, and though treafe of at the fanse time animal food was given to man, fet creation. Noah was commanded only to take a dingle fair of each of the animals, clean beafts, whech are but a few in number, only excepted. It is further obferval le, that notwithitanding this feanty fupply of animals, they had inereafed of much by the time of Nimed, that it then became necenary to tunt and deftroy them; and Nimrod was celcbrated for his courage and Atill in that neceffary employment. "So numerous (adls he) were the anmals before the flood, though bat two of a kind were created, that Dr Woodwand, from the remains of that earth, as woll the animal as vey -tatle productions of it fill preferved, condiucs, thiat 'at the time the deluge came, the eath was foloaded with herlage, and fo thronged withanina, that fuch an expedient was even wanting to cafe it of the bunden, and to make room for a bew fuceetion of its pro. ductuons."
4. Mr Cockburn is of opinina, that America mut of the have been peopled before the food, as the odd conti-fupling of nent could not be fuppofed able to hold the number of anerica, inhabitants.
5. Witi regard to the main dificulty, viz. how mats ow it the animals peculiar to different countries could traved to fuch diftances to and from the ark, Mr Cockburn replies, that America, which Bihop Stillingleet chinily infits upon, has nothing peculiar to it, but what may equally woll be urged both with refpect to Afia and Africa; each of them having animals peculiar to themfelves. It is allo poffible, that there might formerly be a more eafy communication between the

## 15 E I,

 Lenr Abatic and American continents than there is now. See the article Amprica, ris 101-1i3.

Our author likewife obferves, that though the ark refted on mount Ararat, yet we are not told where it was built, which might be far enough from the place where it is commonly frepofed; fo that thofe animats which are peculiar to America misht not have fo far to travel to the ark as is commonly imagined. This argument, however, feems to be very ineondlutive; for though we frould fuppofe the ark to have been conflucted in America iffelf, the animals of Mefopotamia woald have had as far to travel from thence to Anerica, as the American animals from their own country to Mefopotamia, according to the common opinion. But in whatever pait of the tath Noah lived and the ark was built, it was at God's cormand that the feveral kinds of animals came thither in order to their prefervation; and his command could brias then from the farthelt paits of the earth dering the 120 years that the world lay under condemnation. Thonghafter all, none of the aninals might have very far to travel to the ark; for if only one fair of each kind wascreated at frrf, and all of thefe in or near one place, fince they were all brought before Adan, and received names from him, there is no abfurdity in fuppofing that fome of every kind might remain in the country where they were dirl proluced, from whence Noah's habitation might not be very difant. Neither can any objuction be brought trom the extinction of fume fpecies of animals in certain countries of the world, lince they might have been hunted and deAtroyed either loy the lmman race or by other creatures. Thus it is faid, that there are now few or no deer in Switzerland, thouch formenty there were a great many when it was full of woods. 10 Britain alfo there are ro wolves now to be found, though the inand was in. fehed with them in former times.

In confidering the fulject of the deluge, among other crections whid oceur, one is, $\mathrm{b}_{\text {; }}$ what means were the savenous animals, which feed wily upon Acth, fupported in the adi: For this fome authors have fuppofed, that Noal, befides thofe animals whom he touk into the ark for preforvation, took likewife a great number fur flaughter. For this purpofe bihop Wilkins has allowed no fewer than 1825 theep, though he was of opinion, that there were no carmivorous animals before the flood; and this latter opinion is adepted by Mr Cockburn. The idea indeed of flaughteing a number of harmefs animals to fatisfy a few wile rapacius ones, and that tus in a place dengned for the common afylum of the animal creation, feems inconliftent with that feheme of mercy difplayed in the whole tranfaction. It is by much the more proballe fuppofition then, that thengh fome animats had been accuthomed to live on fleth in their tatmal flate, they could neverthelefs fubift upon regetable food. This feum the more probable, as fome animals naturally canimomous, particularly dogs and cats, may be fupponted in their domertic thate by verctable foud alonc. If we exterd this to the whole canine and foline gencra, we thall take in the molt of the beats of prey; as lions, tygers, leopards, panthers, wolves, foxes, hyxnas, \&c. lears are well known fometimes to feed on berries; finkes will eat bread and milk; and there is 保 reafon to forgefe that even the moft car.

N" 29.

## 241 D E L

nivorous birds could not be kept alive by grain or o- Delluge. ther vegetable food. Dy thus excluding fuch a number of ufelefs animals, a very contiderable fpace will be allowed for the circulation of air in the ark, the want of which feems to be the moft inexplicable difWant of a roper cir ficulty, if we may julge from the prefent contitution air the of thinge, It leens indeed to be certain, that no c - aeaten dif. qual number of aninals could fublitt for a twellemonth ficuly. in an egual fipace fo cofoly thut up as they were. The ark, it is true, contained near two milions of cubie feet; but confidering the number of its inhabitants, the great face neceffiary for the food with which they were to be fupplied, and the continual pollution of the air by their dung and lilth as well as the eflovia from their budies, there iecms little probablity that even fuch a valt bulk of anr coild fuflice for any length of time. This difitculty will appear the gieater, when we conlider that any ventilation was impustible, as this could not have been done withont opening both the door and window; and the furner, we are cetain, was not opened until the time that the command was givch to come forth out of the ark. Neither is there the lmalleft probatility, that the opening of a ingle window coold rener the air in fuch a manner as to make it fit fur breathing throughout the whole extent of the ark. In this particular therefore, we mult have recoaric to the imniediate interpulition of Divine power, and fuppofe that the air was miraculoufly preferved of a furfieient degree of purity, as the garments of the liraclites were peferved from turning old, and thein feet from being affected by the juarney through the defert in which they wandered fo long.-Many other quettions concerning the teononiy of the ark might be propofed; as, how they fupphed themfelves will water? in what manner they could ufe fre for the desfLing of their vietuals? Re. But as every anfwer to the w muit be founded wholly upon conjecture, and nowe can pretend that there was a natural impolfibility of eflicting any of the fe things, we forbear to infill Earther upon them. The cale, howewar, is very diflerent with refect to the air necelfary for fuftaining animal life: for here there is a plain impolibility in a natural way; nay, we may even doubt whether the general mais of atmofphere, after being deprived of its electicic matter, or otherwife altered in fuch a mamer as to let fall fuch a quantity of the water it contained, was fit for the fupport of animal life; fo that a miracle would have been neceflary at any rate. 'To this indeed it may be replied, that on fuch a fuppofition, men and other anmals would have been deftroyed, not by the flood, but by the vitiated air tbey breathed. But, as has been already hinted, it is improbable that any living creature could aclitit the violent rain which took place, and which would loos drive the birds from thate facter, as the waters beginning to overtlow the ground would foon expel the human race from their houfes; and it would not be tiil the end of the 40 days and 40 nights that the air could be at its wonft tate, long before which time all an:mal life would be extinct.
We fhall conclude this article with confidering fome Changes of the alterations which are fuppofed to have taken which have place in the world in confequence of the deluge. One tisica lace of the fe is the much grater quantity of water on the in quence of prefers the deange.

## D E L $\{7+5\} \quad \mathrm{D} \mathrm{E} \mathrm{L}$

Deluge.
prefent than on the old world. Dr Keil has indeed endeavoured to prove, that the prefent extent of the furface of the waters is necellary to raife fuch a quantity of vapours as may fupply the furface of the earth with rain and with fprings. In aufwer to this, it is faid, that it may jully be queftioned whether all Springs are derived from the vapuurs raifed by the fun's heat? and, 2 . Whether the primitive earth flood in need of fueh a quantity of rain to reader it fertile as the prefont? Dr Woodward gives the following reafon for fuppofing the antediluvian feas to have been nearly of the fame extent with thofe at prefent, viz. that "the fpoils of the fea, the hells and other marine bodies, are left in fuch prodigious numbers, and in heaps upon leeaps in the earth, beides thofe which have long fince perifhed, that they could not have been left in fuch quantities had not the feas occupied much the fame pace as they do now." This argument, however, is thought by Mr Cockbura to be alfo inconclufive: "For (kays he) I. Animal food, whether fith or fleh, was not ufed by mankind before the Jeluge: but, 2. Suppofe it had, yet for the firt 900 years the numher of mankind was but fmall, and lisely at a great ditance from the fea ; fo that the inereafe of all kinds of fifh during fo long a time muft have been prodigious. We need not be furprifed, then, at the immenfe quantities of the exuvix of marine animals left on the earth by the deluge. But the reafon he brings to prove that the fereral continents of the world were encompafed by feas as they are now, viz. that as there are difierent forts of fifhes in the different feas of the world, fo the exuvire of the fame kind are generally found upon contiguous lands, does not always hold, fince there are fome thells found in the continent which are frangers to the parts of the fea conterminous to thefe continents. That the feas in the prefent carth are vallly more extended, and confequently the dry land fo much lefs in proportion, may likewife loe inferred from the great mutitude of illands that lie near the fhores of the greater continents, if it be true what fome allege, that they are parts broken off by the deluge from the main land, which befure that seached to and beyond them. And.though ifands are thought to be rarely found in the great ocean, yet there have of late been found in the midit of the Indian octan vaft clufiers of illands, ixc."
'To all this it may be replied, That the Mofaic account fays nothing of the extent of the feas either befare or after the flood; but fimply tells us, that the waters were poured out upon the furface of the earth from the windows of heaven and the fountains of the deep, and that as the flood decreafed the waters returned from of the face of the earth. If part of them returned, we have not the leail reafon to fuppofe that the whole did not do fo likewife. That the fith, as well as land animals, were more numerous in the antediluvian world than now when fuch quantities are deitroyed by mankind, is very probable, as we fee they abound to this day in uninhabited places. This may acconnt for the aftonifhing quantities of their exuvia to he met with in many different parts of the eath; but from the formation of iflands nothing can be concluded conceraing the antediluvian world. The late difcoveries have flown that many illands have a voleanic origin; others are formed by the growth of

Vol. V. Part II.
coral ; fome by an accumulation of fea-weeds andother matters Roating on the furface of the occan, and detained upon fand-hanks or funk rocks; whike not a few of thofe near the great continents owe their origin to the quantities of mud brought down by the great rivers which empty themfilves into the occan. Au. thentic hiftory fearce affords an intance of an ifland formed by the braking off a piece from the continent, thourh it does many of illands being joined to continents by fome one or other of the caufes jult mentioned.

The inferior fertility of the earth after the deluge is much infilted upon by the fame author, for the following reafons: " 1 . The grant of anmal food to Noaliand his porterity; which he thinks is an indication of greater burrenuefs in the ground than formerly. 2. Our Saviour compares the days of Noah with thofe of Lot; and as the country about Sodom is faid to have been exceedingly fertile like the garden of the loorl, he is of opinion that the antedilusian world mult have been very fertile alio. 3. As (according to Dr Woodward) the fing earth brought forth all manner of plants of itfelf without any labour or culture of man, and even before there was a man to till the ground, we may reafonably fuppofe that the exterior flratum or furface of the earth confifted of fuch terreftrial matter as was fit for thefe productions; that is, of a rich light mould, affording plentifully matter for vegetation. Now, though God was plealed, upon man's tranfgreffion, to withdraw in part his benediction from the earth ; yet the earth itfelf was unturched till the deluge, the fame furface of rich mould was fill upon it, and brought forth plentifully, efpeciall; when man's culture for corn was added. But the inundation of waters at the deluge greatly altered the conititution of the carth itfelf: it mixed and confuanded this upper ftratum of vegetative earth with other terrefrial matter not fit for vegetation, with fand, gravel, flones, and all kinds of mineral matter, which mut needs render the earth in general much lefs fertile than before, and which made the plough neceflary to dig up the proper vegetative monld and bring it to the furface, and alfo manare or comport to increafe and enrich it ; neither of which before the flood it aeeded. 4. There is a moral reafon why the eath after the flood thould be lefs fertile than before. I'he luxuriant productions of the frill earth, after man's nature became corrupted, and to deviate more and more from righteoufncis, ferved only to excite and foment his luits, and to minitier plentiful fuel to his vices and luxury. To chit off, thencfore, fuch occafion of fin and wickednefs, God, in great mercy to men, retrenched the earth in its former fertility, thereby obliging them tu labour and diligence, and employing moft of their time to procure their nectfary fubfittence, which the earth by diligent culture will dill afford, but not that luxuriant abundance it did before the flood. If we take a furvey of the different regions and countrice of the world, we fhall find this to be the truth of the cafe. Some places, borh in Afa and Anserica, are as it were a paradife in refpect of the reth, to fhow us perhaps what was and would have been the tlate of tise earth had not man linned; but far the greatef part is nothing to be compared to thefe, and evidently thows that effect which the fins of men lad upon the
carth
nouge cartitink. In a word, if we take a furvey of the whole, it cannot be thought that the forlt lieding was eethored to the earth after the flood, or that it came wut of the hands of its maker in the fate it is at pre fent, lince fo great a part of it bears till the marks of the curfe laid upon it."

Notwithitanding, all that is here alleged, the extraordinaty fertility of the ancieat earth mult tall appear very problematical, if we confider all circumitances. Fur,

1. Even at the creation, when the earth was at its utmof perfection, we cannot fuppofe that every part of it produced fpontancounly like the garden of Eden. On the contrary, we are told that this garden was flantel by the Lord Goil, and that Adam was put into it to drefs it and to kestit. It appears, therefore, that even in the Paradifaical tate the earth would not have produced food for man without culture ; for as Gid flumel the finft garden, there can be no doubt that had man continued in his thate of innocence and maltiphed, he mult have plonted other grardens when it became neceffary. After the fall, the fertility of the earth was exprefsly removed, and that not in a flight degree; but if we an judge from the prefent fate of things, it muk have become extremely wild and barren. Thus, when it is fach, "Thorns alfo and thiftles fiall it lring forth to thee;" we may judge of the Atate of the foil frons that which we fee bringing forth thorns and thitlee at this day. Every one knows that an abmand crop of the fe weeds indicates poor ground, which will require a great deal of cultivation to bring it into onder. Nay, that we may be fure that the culdwatin of the earth was at this time no eafy matter, it is likewife tale, "In forrow thalt thou eat of it all the dajs of thy bfe." Fince is would appear, that the antediluvidu earth, inftead of being more fertile, Was much more barren than at prefent. That the laBour of cultivating the grond at that time was alfo fo great as to be almoft intolerable, is evident from the fpeech of Lamech on the birth of Noah: "This furine (fays he) thall comfort ins concerning our work and toil of our hands, concerning the ground which the Lord hath curfed."
2. There is a very evident natural reafon why the antediluvian world hould have been more barren than the prefent, and why the deluge fhould have removed that barrennefs. Under the article Antediluvians, $n^{\circ} 19$, it is hinted, that the purity of the air at that tume was a principal caufe of the longevity of the human race. If this was really the cafe, which is very probable, we mult luppofe the atmofphere to have then contained a greater quantity of dephlogificated air than it does at prefent ; for late experiments have put it beyond doubt, that from this the fupport of animal life is immediately derived. Bat this kind of air, however favourable to animal life, is found to be very unfavourable to vegetation; and therefore, in proportion to its abundance in the antediluvian atmofphere, the animals would be healthy, and the vegetables weak, puny, and fickly. But the deluge, by overflowing the tarth for a whole year, defloyed every animal and vegetable, and confequently induced a vatt putrefaction all over the globe; the confequence of which was the production of an immenfe quantity of what is called phlarilitatedair. This mixing with the pure amo-

## D E L

fphere, vitiated it to fuch a degree as to make it lefs Dimze. friendly to animal life, but more fo to vegetation. Hence the prefent world muft naturally be mure fertile than the former; and not only on this account, but by 1 cafon of its being manured by the ftaynation of the waters npon its furface for a twelvemonth, and the immenfe quantity of animal matter left thy them, the ground, inftead of being leffened in its fertility as Dr IFoodward fuppofes, mult have been reltored, as far as we can judge, to the very tate it was in at its original formation.
3. That this was really the cafe appears probable from what the l)eity faid to Nual after offering up his facrifice. "I will not ( lays he) curfe the ground any more for man's fake." Now this was plainly intimating that the earth was refored to its primitive fertilit; , and that lee would no more take it away : for whon he did fo to the primitive world it was in thefe words, "Curfed is the ground for thy fake." That the curfe here alluded to was really the depriving the earth of its fertility, and not the overfowing the earth with water, is evident ; becaufe, after declaring that he would no more curfe the ground for man's fake, lie adds, "Neither will I again finite every living thing as I liave done."
4. The moral reafons affigned why the prefent world thould be lefs fertile than the former, feem to be inconclufive. However barren we may reckon the earth juft now, it is certain that it produces, or might produce, much more than would fuffice for all its inhabitants. The dificulties which mankind undergo are not at all owing to the barrennefs of the earth ; but to their own conduct, or their oppreidion of one another. Neither does it clearly appear that animal food is really in any degree cheaper than vegetable, but rather the contrary ; fo tbat whatever was the reafon of this grant after the flood, we cannot fairly aferibe it to a forefight of the future barrennefs of the earth.

Another queftion which naturally occurs on the fubject of the deluge is, Whether there was any rain before it or not? The argument againt the exifence of rain before the flood is obvioully derived from the rainbow being made a fymbol of the divine favour immediately after. It is certain, indeed, that unlefs we fuppofe the nature of light or of water to have been different before this event from what it was afterwards, there is a natural impoffibility of the refraction of the fun's light being prevented from howing the appearance of a rainbow whenever the fun and cloud were in a certain pofition with regard to one another. It appears improbable, to thofe who take this lide of the queftion, that the Deity fhould inftitute any thing as an emblem of his difpleafure being turned away, whea the fame emblem had been feen perhaps a very fhort time before the cataltrophe happened. On the other hand it is replied, that there is no abfurdity in Cuppofing this to have been the cafe: for though the rainbow exifed before the deluge, yet it never was appointed to be the fymbol of this particular event, viz. the reconciliation of the Deity ; and the impoffibility of vegetables being fupplied with a fufficient quantity of moifture without rain is likewife urged as a decifive argument. Still, however, it appears, that even vegetaion may fubfif, and that in its utmof per. fection,

Denal: fection, without rain: for we are informed, that by $\|_{\text {I }}$ mans of a milt the ground was originally watered, and vegetables fupplied with moilture, before there was any rain; and if this was the cafe at one tine, it might have been at any other, or at any number of times we can fuppofe. Indeed, as matters ftand at prefent, this would undoubtedly be a very feanty fupply; and perhaps fo it was in the antedilivian world: and thas the want of rain might have been one caufe of that barteneds in the antediluvian world which we have already mentioned as probable, and which Mr Bryant mentions as the opinion of all the ancient mythologins.

For particular dcluges, or overflowings of varions pints of the earth by water, fee the article Inundation.
1)EMADES, a famous Athenian, who, from being a mariner, became a great orator, and appeafed Philip by his cloquence, after the fanous vidory over the Athenians at Cheroneat, in the $33^{8 \text { th }}$ year 13 . C.

DEMIAN, or DEMESNS, in its common acceptation, is ufed for the lands round a manur-houfe, ocengied by the lord.

Denitu, or Demefne, in law, is commonly under. ftoud to be the lord's chief manor-place, with the lands thercto belonging, which he and his anceftors hare, time out of mind, kept in their own manual occipation.

1) MMAN1), in its popular fenfe, denotes a calling for or requiring one's due.
1)emand, in law, has a more fpecial fignification, as contraditinguihed from plaint: for all civil actions arefurthod cither by demands or plaints; according to which the purfuer is colled either demandunt or plantif: viz. in re:il delions, demandant; and in perfomal actioms, plainiff. See l'laintifa.

DEMESNE. Sec Demain.
Demesnelands. See Revenuf, in 5 .
DEMEI'AE (anc. geog.), a people of Britain, confidered as a branch of the Sihures, occupying that inner corner formed by the Brittol Chamel and the inth Sea.

DEMLTRIA, a feftival in honomr of Ceres, cadted by the Greeks Dimefer. It was then cutumary for the votarics of the goddefs to lath themfelies with whips made with the bark of trees. The Athemians had a fulemnity of the fame name in honour of Demetrius I'oliurctes.

DEMILTRIOWITZ, a sity of the duchy of Smoleniko, in the Ruman empire, lituated upon ike river Ugra, in E. Long. 37. O. N. Lat. 53. 20.

ITMAETRILS, a fon of Antigonus and Stratonice, furnamed Folioretes, "Dealroger of towns." At the age of 22 , he was fert by his father againf Ptulemy, who invaded isyria. He was defeated near Gaea; but he foro repaired his lofs by a victory over one of the generals of the enemy. He afterwards falled with
 nians to liberty, by freeing them from the pown of -reser Callander and Dodemy, dud expelling the gatifon. wheh was itationed there ander Demetria; Phakereus. After this fucceifful expelition, he belieged and took Munyehia, and defeated Catfander at Thermopyle. His reception at Athens after thele vidurics wats attended with the greateft fervility, and the Athenians were not athamed to raife attars to him as to a god, and confult his oracles. 'Ithis uncommon fuccefs railed the jeatoufy of the fucceffors of Alexander and Scleucus Calfmder, and L.jfimachis united to dettroy Antigonus and his fon. Their hotite arnies met at Ipfus, 299 years before the Augutan are. Antigonus was killed in the battle; and Demetrius, after a Cevere lofs, retired to Ephefus. His ill fuccefs raifed him many enemies; and the Athenians, who had lately adored him as a god, refufed to admit lim into their city. He foon after ravaged the territory of Lyf. machus, and reconciled himfelf to Seleucus, to whon he gave his daughter Stratonice in mariage. fithens now laboured under tyranny, and Demetrius relieved it and padoned the inlabitants. The lofs of his poffeffons in Alia recalled hin from Greece, and he citablithed himfelf on the throne of Macedonia by the murder of Alexander the fon of Callander. Here he was continually at war with the neisthouring thates, and the fuperior power of his adverfaries obliged hims to leave Macedonia, atier lic had fit on the throne for fevea years. He palfed iato Alin, and attacked fome of the prowinces of I yhmachus with various fuceelis ; but the mine and pettlence delroyed the greatelt part of his army, and he retied to the court of sclencus for fupport and affilance. He met with a kind sectption: but hoftilives were foon began ; and after be had gained tome advantages over his fon-in-law, Demetrias whe dotall, fonfaken by his troops in the theld of batte, and becume an eafy prey to the ences. 'llangh he ads keyt in contiaement by his fom-in. law, yot he mantaned himfelf like a prince, and palled his time in hanting and in every laborinus x . ureife. His for Antegonas offered Selences all his polfeffons, and even his perion, to procus his father's hiberty; but all proved uravaihing, and Demetrius died in the 5 th $^{\text {th }}$ year of his age, after a confinement of three years, 286 years before Chrift. His remains were given to Antigonus, and honoured with a fplendid runeral pomp at Corimh, and thence convesed to Demetrias. His posterity remained in portetlion of the Macedonian throne till the age of Pcreus, who was conquered by the Rumans. Demetrius has rendered himfelf famous for his fondncls of diffipation when among the diffolute, and for his love of virtue and military glory in the dield of hattle. Ile has been commended as a great warrior ; and his ingenious inventions, his warlike engines, and itupendous machines in his war with the Rhodians, jultify his clams to that character. He has been blamed for his voluptuous indulgenees; and his biographer obferves that no Grecian prince had more wives and concubines than Poliorcetes. His obedience and reverence to his father has been julty admired; and it has been obferved, that Antigonus ordered the ambatadors of a foreign prince, particularly to acmark the cordiah5132
iy

## D E M

Demetrius ty and friendisip which fubfifted between him and his fon.

Demetrius, furnamed Gonatas, fucceeded his fa. ther Antigants on the throne of Macedonia. He reign. cu 12 years, and was fucceeded by his fon Philip.

Demetrius, a fon of Philip, king of Macedonia, Jelivered as an hoitage to the Romans. His modelty delivered his father from a heavy accufation laid before the Roman fenate. When he returned to Macedonia, he was falfely accufed by his brother lerfeus, who was jealous of his popularity, and his father two creduloully coufented to his death.

Uemetrius I. furnamed Soter or Savior, was fon of Seleucus Philopator the fon of Antiochus the Great, king of Syria. His father gase him as a holtage to the Romans. After the death of Seleucus, Antiochus Epiphanes, the deceafed monarch's brother, ufurped the kingdom of Syria, and fucceeded by his fon Antiochus Eupator. This ufurpation difplafed Demetrius, who was detained at Rome. He procured his liberty on pretence of going to hunt, and fled to Syria, where the troops received him as their lawful fovereign. He put to death Eupator and L! fias, and eftablifined himfelf on his throne by cruelty" and opprefion. Alexander Rala, the fon of Antiochus Epiphanes, laid claims upon the crown of Syria, and defeated Dumetrius in a battle, 250 years before Chirit.

Demetries 11. furnamed Aicianor, or Confueror, was fun of Soter, to whom he fucceeded by the alfiftance of Ptolemy Philometor. He married Cleopa. tra, the daughter of Ptolemy, who was hefore the wife of the expelled monarch Alexan ler Bahn. Demetrius gave himfelf up to lusury; and voluptuoufnefs, and fuffered his kingdom to be genverned by his farourjes. At that time a pretended fion of Bala, cailed Diodorus Tryphon, feized a part of Syria; and Demetrins, ts oppofe his antegonilt, made an alliance with the Jews, an marched into the talt, where he was taken by t? Parthians. Phraates kintr of Parthia gave him his daughter Rhodogyne in marriage; and Cleopatra was fo incenfed at this new comection, that the gite herfelf up to Antiochus Sidetes her brother-in-law, and married him. Sidetes was killed in a battie aganit the Parti,ians, and Demetrius regained the poffition of his kingdom. His pride and opprellion rendered him odious; and his fubjects anked a king of the home of Seleucus fiom Prolcmy Phyicon king of Egypt : and Demetrius, unable to refilt the power of his cnemies, fled to Ptolemais, which was then in the hands of his wife Cleopatra. The gates were thut up againtt his approach by Cleopatra; and he was killed by order of the governor of 'lyre, whither he had fled for protection, A. U. C. 627. He was fucceeded by Alexander Zebina, whom Ptolemy had raifed to the throne.

Demetrios Pbalereus, a celebrated orator and peripatetic philofopher, was the feholar of The.phraftus. He acquired fo much authority at Athens, that he governed the city for ten years; and ruled with fo much wifdom and virtue, that they fet up 36 ftatues in honour of him. By the flanders of fome malicious perfons in his abfence, he was, however, condemned to die; and bis images vere puled down: which when Demetrius beard, he faid, they could not pull down that vitue fur which thofe imares were fet up. He efcaped into

Egypt, and was protected by Ptolemy Lagus. This Demetrius king, it is faid, afked his advice concerning the fucceffron of his children to the throne; viz. whe her he Demiurge. ought to prefer thofe he had by Euridice to Piolemy Philadelphus whom he had by Berenice? and Demetrius advifed him to leave his crown to the former. This difpleafed Philade!phus fo much, that, his father bein dead, he banithed ibemetrius; who was afterwards killed by the bite of an afp. Demetrius compofed more works in profe and verfe than any other peripatetic of his time; and lis wrings confited of poetry, hiftory, politics, rhetoric, harangues, and embaffes. None of them are cxtant except his thetoric, which is ufually printed among the Rhetures Selectio.

Demetrius, a crinic philufopher, difciple of $A$ pollonius Thyaneus, in the age of Caligula. The emperor withed to gain the philofopher to his intereft by a large prefent ; but Demetrius refufed it with indignation, and Gaid, If Caligula withes to bribe nue, let him fend me his crown. Vefpafian was difpleafed with his infolence, and banithed him to an ifland. The cynic derided the puniflment, and bitterly inveighed aramet the emperor. He died in a great old age; and Scneca obferves, that " rature had brought him forth to fhow markind that an ce:alted genius can live fecurely without being corrupted by the vice of the furround. ing wofld."
DEMI (formed from dimidiam), a word ufd in comporition with other words to tignify balf.

DEMI-Atici, boroughs or larger villages of Attica. The Athenian tribes were diftributed into Demi. Homer, in his catalogue, dikinguithes the Athenians by the appellation $D_{\text {emos. And when Thefeus prevailed }}$ on them to quit the comery and fettle at Athens, they fill comburd to frequent the Demi , and to perform their feveral religious ceremonies there (Padanias, Livy).

Dem-(alatrin, a piece of ordnance ufually 4 inches Eore, 2700 pound weight, so feet long, and carrying point blank 175 paces.

Denn-Culverin of the laffiae, is $4^{\frac{1}{4}}$ inches bore, 10 feet long, and zoco pound weight. It carries a ball of 4 inches diameter and of 9 pounds weight, and its level range is 1 th paces.

Drm-Calaceria of the larget fort, is $4 \frac{3}{4}$ inches bore. ret feet long, and weighs 3000 puands weight. It carrics a ball $4^{\frac{2}{2}}$ inches diameter, weighing I 2 pounds II ounces, point blank i78 paces.

## I) Fmb-Gad. see Hero.

Dr.wt-Gorge, in fortitication, is that part of the polygon which renains after the flank is raifed, and groes from the curtin to the angle of the polygon. It is half of the vacant fpace or entrance into a baltion. $^{2}$

Deng-Quarer, a note in mufie, two of which are equal to a quaver.
D) Eti-Semi-Quajer, in mulic, the fhortelt note, two of them being equal to a femi-quaver.

OLMISE, in law, is applied to an eftate either in fee-limple, fee-tail, or for term of life or years; and $f$, it is commonly taken in many writs. The king's death is in law termed the demife of the king.

Dimise, and Redemise, denote a couvemance where there are mutual leafes made from one to acother of the fame land, or fomething out of it.

DEMIURGE (from druso;, which denotes a purlic fircant,

# D E M 

Democracy, fervant, and efyov suork), in the mythelogy of the eat Demeri ern philufophers, was one of the fons employed by tus.
thy were the moft diftempered. Demoeritus died, according to Dingenes Lacritus, in the 3 bift year before the Chritian ra, aged 100 . It is faid that he pot out his eyes, in order that he might meditate more profoundly on phitofoplical lubject: ; but this has litue probability. He wats the author of many books, which are luit; and from thefe Epicharus borrowed his phikefophy.

DEMONSTRABLE, a term need in the fohools to ficsuify that a thing may be clearly pooved. 'Thus, it is demontlrable, that the three angles of a triangle are equal to two right ones.

DEMONSLRALLON, in logic, a feries of fyllogifms, all whofe premifles are cither definitions, Eelfevident truths, or propofitions alreaty efablithed. See Lugic.

DEMONSTRATIVE, in grammar, a term given to fiuch pronouns as ferve to inticate or point out a. thing. Of this number are bion ber, bor, among the Latins: all this, thut, thefe, thore, in Englifh.

DEMOSTHENES, the fanous Athenian orator, was born at Athens 3 Si B. C. He lolt his father at feven years of age ; and was placed under the conduct of guadians, who robbed him of his fubltance, and negleted his education. Demothenes repaired this lofs by his love of eloquence and his extraordinary abilities. Hebecame the difciple of lfens and Plato, and applice himfelf to thaty the urations of Ifoerates. At the age of 1 , he gave an carly proof of his eloquence and abilitien againt bis guardians, from whom he obtained the retribution of the sreatelt part of his eftate. His riligy talunts were, however, impuded by various natmal detects. But thefe were at lafl conquered by dint of refolition and unwearied attention. He declained by the fea-fhene, that he might be ufed to the noife of a tumaltuons affembly; and with pebbles in his month, that he might courcet a dufet in his fepecin. He fuadifed at home with a maked fword han ring wer bus thonder, that he might eheck an ungracefuk motion to which he was fubjoct. I-Ie alfo confined himelf in a fubterraneons care, so devote himfelf more clrfely to ikudions purfoits; and to eradicate all curiofity of appearing in public. he fhared one half of his heall In this folitary retirement, by the help of a glimmering lamp, he compuied the greatelt part of hie orations, which have crer been the admiation of every age: though his contemporaries and rivals inveighed againft them, and ublemed that they fmelt of oil. His alilities as an erator raifed him to confequence at $A$ thens, and he was foon placed at the luead of govemmetut. In this public capacity he rouled his countrymen from their indolence, and anmated them againtt the encroachment of Pinlip of Macedonia. In the beate of Cheronea, lemolhemes betrayed his putilkanimity, and fared his life by Hight. After the death of Philip, le declared himelf-warm!y aceant his ton and fuccefor Aleyander; atid when the Maccdonians domanded of the Athenians their orators, Demolthenes reminded his conntrymen of the fabie of the fheep which delivered their dogs to the wolves. By the prevalence of $]^{\text {buty }}$, however, he was foreed to retire from Acthens: and in his banithment, which he palled at Trezen and Eigina, he lived with more effaminacy than trac hervifm. When Antipater matu wat againd Grecee aftor the death of Alexander, Demote-

Demonfrable II
Demon-
$\underbrace{\text { helles. }}$ lities and infupportable arrogance; and his exectlive lut of cmpire effaces his talents and virtues. He is reprefented as elaming dominion over the new world he has formed, as his fopereign right : and exchuding totally the fupreme Deity from all concemment in it, he demands from mankind, for himfle and his afociates, divine honours.
D) WMOCRACI, from Inuer people, and xpatan yo commend or grovern; the fame with a popular government, whercia the fapreme power is lodged in the hainds of the people: fuch were Rome and Athens of ohl; but as to our modem republics, bafil only excepted, their government comes nearer to ariltoeacy than demucraty. S.e L.sw. $11^{\circ}$ it.

DESIOCRITCS, une of the greatelt phitofophers of antiquity, was born at Abdera, a town of thrace, alout the 8uth Olympiad; that is, about $f^{60}$ y cars befure Chrit. His father, fays Valerius inaximus, was able to entertain the army of Xerses; and Diogenes Laertius adds, upon the teftimony of Exrodotus, that the king, in requital, prefented lim with fume Magi and Chaldcans. From thefe Masri and Chaldeans Democriturorecived the fort part of his eduatoon ; and from them, whill yet a boy, he learned theology and affronomy. Ife next applied to Leucippus, and learned from him the fytem of atoms and a vacoum. His father dying, the three fons, for fo many there were, divided the eftate. Democritus made choice of that Irit which confited in money, as being, though the leaf thare, the moft convenient for travelling; and it is fald, that his portiom amomed to above roo talents, which is neat 20,000 . Stertar. Ilis extraordinary inclination for the feiencwind for knowledge, indneed him to travel into all parts of the word where he hope? to find learned men. He went to villt the prielfe of Egypt, from whom he tearned genmetry; lue confulted the Chaldeans and the Perfan phibofophers; and it is faid, that he penctrated even into India and Ethiopia, to confer with the Gymnofophits. In thele travels he walted his fubflance; after which, at his return, he was oistiged to be maintained by his brother; and if he laad not given proofs of the greatef andertanding, and thereby procured to himbelf the highet honows, and the Etrongeft interett of his country, he would have newred the penalty of that law which denied the interment in the family-fepulcher to thofe who had tpent their patrimony. After his return from travilling, he lived at Abdera, and groverned there in a moft abfolute mamer, by virtue of his confummate wifdum. 'The magiftrates of that city made him a prefent of 50 ta. tents, and crefed frathes to him even in his lifetime: hat being naturally more inclined to evnemplation than delighted with public honours and employments, be withdrew into folitude and retirement. Demuchitus inceffantly laughed at human life, as a cominued farce, witheh made the inhabitants of Abdera thimk: he was mad; on which they fent for Aippocrates to cure him: but that eclebrated phyfician laving difonufed with the philofopher, told the Abderians, that he had a great veneration for Dennocritus: and that, in his opinion, thote who eflectacd themelves the molt heal-

Pemefe. henes was publicly recalled from lis exile, aud a gratley bunes. was fent to fetel ! !im from $\mathbb{E}$ gina. His retarn was attended with much fplendor, and all the citizens crowded at the Pireus to fee him land. His triumph and popularity wou dhort. Antipater and Craterus were near Athens, and demanded all the oraton to be dehiered up into their hands Demanthenes fled to the tengle of Neptume in Calauria; and when he fav liadt all hopes of fifuty were samitied, he took a dofe of poifor, which he always carried in a quill, and expised on the day that the ' i hermoplianal were celebated, 322 years before Chritt. The Athemians raited a Lrdzen tatue to his honour, with an ineription tandlated into this dintich:

Demothanes has brea defenvedly called the prince of orators. Indecd no orator had ever a finer rield than Demothenes in his Olynthiacs and Philippics, which are his apital orations; and undubtedly to the greatuefo of the fubject, and to that integrity and public fiait which breathe in them, they owe a lange purtion of their merit. The fubject is, to excite the indignation of his countrymen againg Philip of bracedon, the publice enemy of the lionties of Grece: and to guard them againit the treacharous meafurss by which that crafty tyrant endeavoured to lull them iato a negket of their danger. 'l'o attain this end, we lee him ufe every proper means to animate a people ditinguithed by jutice, lumanity, and vatuor; but in many iallanes becone comupt and degenctate. He boldly accules them of renality, indolence, and indifference to the public grood; while, at the fame time, he sominds them of their former sfory, and of their prefent refources. His contemporary orators, who were bribed by Philip, and who perfaded the people to peace, he openty reproaches as traitors to their conntry. He not only prompts to vigurous mealures, but tuaches how they are to be carried into ex cution. His orations are throngly animated, and full of the impetuctity and ardour of public fpirit. His compolition is not ditingenithed by omament and plendur. It is an energy of thought, peculiart'y his own, which forms his character, and raites him above his fpecies. He feems not to attend to words, but to things. We forger the orator, and think of the fubject. He has no parade and oftentation, n.) fudied introductions: but is like a man full of his fubject; who, after preparing his audienes by a fentence or two for the reception of plain trutles, enters directly on bulinefs.

The ityle of Demothenes is Atrong and concife; though fonetimes, it matt be confefced, harth and ab:upt. His words are highly exprellive, and his arrangement firm and manly. Neglicent of heffer graces, the feems to have aimed at that fublime which lies in sentiment. His action and pronanciation are faid to have been uncommonly vehement and ardent; which, from the mamer of his writings, we thould readily belicere. His character appcars to have teen of the aufture rather than of the gentle kind. He is always grave, ferious, paffonate; never degrading himfelt, nor attempting any thing like plafantry. If lis admirable cluywece be in any refpect fanloy, it is ihat he fometimes borders on the hard and dry. He
may le thought to want fmoothnefs and grace; which is attribated to his imatating too clofely the manner of Thucidides, who was his great model fo: 1 yyle, and whofe hitory he is faid to have tranforibed eight times with hio unis land. But thefe defects are nore than atoned for by that materly furce of mafeutine eloquence, which, as it overpowered all who heard it, cannot in the prefent day be read without emotion.

Cicerocills him a perfect model, and luch as he him. fllf withed to be. Thefe two great princes of eloquence have been often compared tngether; but the judgment helitates to which to give the preference. The Archbithop of Cambray, homuer, fems to have itated their merits with erveat jultice and jerticuity in has Refte. tions on Rhetoric and Poetry. 'The patage, tranfiz. ted, is as follwws. " 1 dos mot hentate to dectare, that I think Demolthens fejericr to Cicero. I am jerfuaded no one can admire Cicero more than I do. He aforns whatever be attempts. He dess honour to language. He ditifoles of wods in a manner peculiar to himfelf. His ityle has great varicty of character. Whencrer he pleafer, he is even concife and wehement; for intlance, agant Catione, aganlt Verres, againt Antany. Dut ornament is too vilable in his writings. His at is wondafu!, but it is perceined. Whea the orator is providing for the fafety of the republic, the furgets not himfelf, nor perinits uthers to forget him. Denofllunes feems to diape from himfelf, and to fee nothing but his country. He Secks not elegance ot expredien; unfoasht for he poflefes it. He is fupsrior to admiration. He makes ufe of language, as a modelt man dues of drefs, unly to cover lim. He thunders, he lightens. He is a torrent which carrics every thing betore it. We cannot criticife, becaufe we ase not ourtives. His fubject enchains our atten. tion, and makes us furget his language. We lufe him from our light: Philip alone oceupies our minds. I am delighted with buth thefe oratos ; but I confers that 1 an ls is affected by the intinte art and magniticem eloquence (f Cicero, than by the rapid fimplicity ur Demonthnes."

DEMPSTER (Thomas), a very learned mar, but of a fugular character. He was bora in Scothand, but we do not find in what year. He went over iu france for the fake of embracing the catholic religion, and taught clafleat leaming at Paris about the begiming of the 1 -th century. 'Thu' his bufinelis was to seach flool; yet he was as ready to draw his fword, and as quarcllime as if he had been a duellitt by profelfion: and it is faid, that there fance patied a day but he had fomething or other of thiskind upon his hands. This Spirit and tern of temper dew hius inte many ferapes; and one in particular, which whiged him to quit the conntry. Grangier, principal of the college of Beauvais at Paris, being obliged to take a joumey, appointed Dempftu his fubllitute. Dempiter canfed whip a ichotar, in full fchool, for challaging one of his fetlows to bight a duel. The felsolar, to revenge this arfront, brought three gendemen of his relations, who were of the king"s life-yuards, into the college. DempAter made the whele cullege take ame; hamilrung the there life-gnard-mens horfes before the college gate; and put himfolf into liuch a pollure of deftuce, that the three fparks were forced to alk for quarter. He gave then their lives; but imprifuntd them, and did

Demorhents, Demyther.

D E N
Dempter not releafe them for fone days. They fought another $\underbrace{\text { Dentigh. }}$ way to revenge themfetres: they caufed an information to be made of the life and moral behaviour of Demptter, and got fome witneffes to be heard againlt him. Upon this he went over to England, whare he found refuge; but did not make any long flay. He went abroad again, and read lectures upon polite leaming in feveral unverfities; in that of Nifnes particularly, where he difputed for a profefor's chair, and obtained it. He went to Rolugna, and was profeffor there for the remainder of his life; and was then alfo admitied a member of the Academy della Rotte. He died there in Scptember 1625 , leaving behin him feveral learned works; as Commentaries on Kofous de Ahtiquitatibus Ronanoram, and upon Claudian; \&e.; four books of Epitles; feveral dramatic pieces, and nether poems ; fome books of law ; an Apparatus to the IIthory of Seotland; a Martyrology of Scotland; and a Litt of the Scuttith Writers.

DAMPStar of Cout, the name formerly given in Scotland to the common executioner or hangman.

DEMSTER, or Deemster. See Deemster.
DEMULCENTS, among phyficians, medicines good againf acrimonious humours. Such are the roots of marih-mallows, of wbite lilies, of liquorice, and of viper-grafs, the five emullient herbs, \&c.

DEMURRACE, in commerce, an allowance made to the malter of a lhip by the merchants, for flaying in a port longer than the time firt appointed for his departure.

DEMURRER, in law, a fop put to any action upon fome point of difficuly which mul be determined by the court, before any further proceedings can be had in the fuit.

DEN, a fyltable which, added to the names of places, fhows them to be fituated in valleys or near woods; as Tenterden.

DENA RIUS, in Roman antiquity, the chicf filver coin anong the Romans, worth in our money atout fevenpence three farthings. As a weight, it was the feventh part of a Roman ounce.
Denarius is alfo ufed in our law-books for an Englifh penay.

DENBIGHSHIRE, a county of Wales, bounded on the fouth by Merioneth and Montgomery thires, on the north by Flinthire and the Irith Sea, on the welt by Caernarvon and part of Merionethithire. It is about 40 miles long and 21 broad. The air is wholefome, but. Iharp; the county being pretty billy, and the fnow lying long on the tops of the mountains. The foil in general is barren; but the vale of Chwy, fo called from its being watered by that river, is a very fertile pleafant fpot, of great extent, and well inhabited. The chief commoditics are black cattle, fheep, and goats, rye, calied here amelcorn, and lead-ore. The county fends two members tu parliament, viz. a knight for the fhise, and a burgefs for Denbigh the capital.

Denbigh, the capital tuwn of Denbighthire in N . Wales. It is feated on the fide of a rocky hill, on a branch of the river Cluyd, and was formenly a place of great frength, with an impreguable cafte, now demolifhed. It is pretty large, well built, and inhabited by tamers and glovers, and gives the title of Earl to the noble family of Fielding. W. Long. 3.30. N. Lat. 53.15.

DENDRACFATES, in matural hitenry, the name ufed by the ancients for an extremely elegant and beautiful fyecies of agate, the ground of which is whitih, variegated wih veins of a brighter white. Thefe veins are beautifully difpoled in a number of various figures; but generally in many concentric in egular ciacles, drawn rond one or more points. It is common alfo, in rarious parts of this itone, to find very beautiful delineations of trees, mofes, fea-plants, and the like, fo elegantly expreffed, that many have erroneouly taken them for real plants included in the fubflance of the fonce; whence the name dendrachates.

DENDRANATOMY, a term ufed by fome for a defeription of the various parts of trees; as root, truak, branch, bark, wood, pith, flower, fruit, Sic. See Plants, Vegetation, \&e.
1)ENDROMETER (fiom cisiav a trea, and uerge I madfure), an inftrwnent latdy invented by Meffrs Duncombe and Whitel, for which they obtained a patent, fo called from its ufe in matiuning trees. This phate infrument confitts of a femicircle A, diviled into two CLXE. quadrants, and graduated from the midile; upon the diameter D there haugs a phemmet L for fixing the inflrument in a vertical polition ; there is alfo a chord I) patallel to the dianeter, and a radins E, pafing at right angles through the dianeter and chord. From a point on the radius hangs an attineter C , between the chord and diameter, to which is fixed a frnall femicircle $G$, and a frew, to confine it in any pofition. The altimeter, which is contrived to form the fame angle with the radius of the inltrument as the tree forms with the horizon, is divided from its centre both ways into forty equal parts; and thefe parts are again fubdivided into halves and quarters. Upon the fmall femieicle $G$, on which is accounted the quantity of the ande made by the altimeter and radius, are ex. preffed degrees from to thizo, being 30 on cach quadrant. The radius is nembered with the fame feale of divifions as the altimeter. Thece is alfo a norius to the fmall femiciacle, which thous the çantity of an angle to every tive miantes. On the back of the inftrument the toock M of the fliding piece is confined to the axi3 N , which moves concentically parallel to the elevation index $F$ on the oppotite fide, to which it is fixed. Thi index is mambered by a fale of equal divifions with the altimeter and radius: at the end of the index is a nunius, by whieh the angies of eleration above, or of deprefion below, the horizon, meafured upon the femicirle of the infirument, are determineal to every five minutes. There is allo a groove in the radius, that fides acrofs the axis by means of a forew I, working betweell the chord and f m circle of the inftrument; and this fcrew is turned by the key 0 . Upon the fock M is a fliding piece ${ }^{\mathrm{P}}$, that alway; acts at right angles with the allimeter, by means of a gronve in the latter. T'o the fhank of the fliding piece is affixed a noveable limb Q , which forns the

## D E N

in that part where the horizonal dilanee was taken, is meaturel with the tape-line; and a fixth part of
this circuanference is added to the diftance on the rathis circuaference is added to the dittance on the rater, becaufe the tape-liae, in takints the ditance, cennot be anplied to the eentre of the body of the tree: then the clevation index is lowered to that part of the tree, of which the diameter is to be taken and forewen fatt. Set the moveable limb of the diding piece quite ftraight, and the edge of the horizontal index upon the fird divition of it. Turn the whole inftrament about to the left hand till you fee through the fights the left tide of the tree cut exactly by the perpendicular wires; then the intrument being lixed, move the fights only upon the fliding picee, till you fee the right fide of the tree cut alion by the perpendicular wires; and you will find the true diamcter marked by the horizontal index upon the fliling piece, which is to be entered in a diftinet column of the field-book.

For the boughs: let the diflance on the radius be now rednced to its former quantity, and the elevation index moved upwards till the bough is feen through the fights and ferewed fatt. Set the moveable part of the fliding piece in a pofition parallel to the bough, and the edge of the horizontal indes on the firt diviflon of it. Turn the whole indrument about till you fee throung the fights the fhoot of the bough clufe to the truak cut by the perpendicular wires; then move the dights till you fee the other end of the bough cut by the laid wires, and note the feet and inches marked by the horizontal index on the moveable limb of the fiding piece, which will give the true length of the bough to be inferted in the fild-book. And the girth of the bougly may be obtained by directing the fights to that part of it w'ole ginth is defired ; then by muring the elevation index downards till you fee the under ide of the bongh cut by the horizontal wircs, and these noting the feet and inches marked by the faid index on the altimeter; after which, let the tevation index be noved upwards till the upper fide of the bough cut by the horizontal wires is feen; the fect and inches marked upon the alimeter are to be nuted as before. The former quantity fubtrakted from the latter will hive the true diameter of the bough, which is cutered in the fied book. The true folidity both of the budy of the tree and of the boughs may be found from the diameter and loagtho in tables calculisted for this purpufe.

The dendrometer, fitted to a theodolite, may be applied to meaturing the heiches and dittane of (h) jeets, accutrible or inaccefible, whether fituated in planes parthlel or ublione to the phae in which the inftrument is placed. It may be alfo ufed for taking all angles, whether vertical, herizonal, or oblique, in any polation of the planes in wh they are formed; and thus fur facilitating the practical operations of engineering, land furves ing, levelling, mining, dic. and for performing the variou; cafes of plane trigonometry without calculation ; of which the inventos. have fiubjuined to their accomat of this intumat many examples.

DENDROPRORIA, in antignity, the carring of boughs or branches of trees; a religious ceremony fo called, bucaufe certain priefts calied from thence dendiuphori:

## D E N $[753] \quad \mathrm{D}] \mathrm{N}$

## Dench demboshari, trec-bearws, matehed in proceffon, carry

ing the branches of trees in the ir hands in honour of
fome god, as Bacchas, Cylate, Sybams, \&e. The
college of the dendrophori is often montioned in anciont mables; and we fiequently fee in bafor retievos the bacebanals reprefented as men carying litule harubs or branches of trees.
D) DNEB, an Arabic term fignifying tail, wed by aftronomers to denote ferctal tised Aars. Thus, doneb elat, fignifies the bright liar in the lion's tail. Dowh adigege, that in the fwan's tail, \&ec.

IIINHAM (Sir John), an eminent Foglifh poct, the only fon of Sir John Denham, chief baren of the exchequer in Ircland, and one of the lords commifioners there, was benn in I ubblin in 1615 ; Lut his father, in 1617 , being made a baron of the exchequer in England, lee reccived his education in that comentry. In his youth he f llowed ganing more than any thing clfe; but, in Ibat, publiflud a tragedy called the Soply, which "as much admired by the bef judges; and, in $16+3$, wrote his famons poem called Cooper's Hill; which Alr Diyden prononances will ever be the fandard of good writing for majelty of ttyle. Denham was fent ambaffador from Chates II. to the king of Poland; and at the Ropomation was made furseyor-general of his majuty's buiklings, and coeated knight of the Dath. On obianing this port, he is faid to have renutnced his poetry for inore important fudies; thongh he afterwand wrote a fone copy of verfes on the death of Cowley. He died at his office in Whitehall in 1668 ; and has wotks have been often fance printed.

DENIER, a mail Frencil copper-coin, of whicit twelve make a fol.

There were two kinds of deniers, the one tournois, the other parifis, whereof the latter was worth a fourth part more than the former.

DENIZEN, in law, an alien made a fubject by the king's letters-patent; otherwife called donaijon, becatufe " his legitimation procceds ex donatione aggis, from the king's gift."

A denizen is in a kind of middle fate between an alien and a natural bern fubject, and partakes of both of them. He may take lands by purchafe or devife, which an alien may not ; but cannot take by inheritance; for his partert, through whom he mult chaim, being an alien, had no inheritable blood, and therefore could convey none to the fon; and, upon a like defeet of bluod, the iffue of a deni\%en born before denization, cannot inherit to him; but his illue born after may. A denizen is not cxeufed from pilying the alion's duty, and fome sthermencantile budens. Aud roo deniren can be of the prive conacil, or either honfe ef parliament, or have any office of truth civil or military, or be capalle of any grant of lands, sic. from the crown.

DENMARF, one of the nof ancient monarchies in Europe, comprehending the peninfula of futhond, and the ifands of Zealand. Tumen, Sc. But Denmark, poperly fo called, is only that part of Scandinavia which formerly went by ite name of cimbriag charfongus, and now is callex Futhand. Including HolAtein, it is bounded by the fea called the Catesate on the north; by the Jaltic on the eall ; by the river Elbe, which feparates it from Bremen, on the fouth; and by

Vol. V. Parc LL.
 extending from 54.40 to $5 \%$ 20. N. Eat.

The origin of the bame Denombe is wey ancertain. Name The mont probable conjectutc contcrning it is that of Name Seaso-Crammetious, the molt ameiont and bed Daminderives. hillorian. I Iederives it from 1 Ran the fon of Jhambe, the firll kings, and Mark, or Ahere, fignifying a courtry in leveral diakets of the Tentonic; aceoding to which etymology, the word Damard dignifies the land, or country, of Dan. --This Dan is thourtht to Dan the have lised abont 103 gears before the Chritian era. fint king. Almoll all hithorians agres that he was the fon of Funth, a native of Zemiand. His poffefloms and inAluence were very confiderable, not only in Zatand, but in the iftands of Langland and Mona. It was lis conage, howerer, and tkill in the art of war, hat in. daced the inhabitants of Denmark to choofe him for their king. IIe was called to the affifance of the Jutlanders upon an inruption of the Saxons into theirterritories, and pomifel the fovereignty of the comenty if he drove out the enemy. Ga this be immediately raifed an amy, gained a complete victory over the Saxons, and obliged them to leave the comery; and he was accordingly clected king.

In fuch early ages as thefe, we are not to 10 k for Miatry of any authentic hifory either of this of any other king- this cour'ry dom. The hiftory of Demmark, for a great number of luauy ares ages after the reign of Dan, is filled with fabulous exploits of herocs, encounters wath giants, diacons, Exc. One of the ir kings named Fromo, who reigned about For years before Chrifl, is faid to have concueved all Britain, Slefwick, Rufla, Pomerania, Hultio, sco an affertion which cannut caffily oe credited, contidering the difficuly which fucceding warriors, even the greatell in the work, found to fubdue the inhabitants of thofe comotries.- It is certain, however, that anciently the kingeon of Denmark made a much more con picuons figure than it docs at prefent. The Danes appear to have had a very confiderable maval force at. moll from the Foundation of their empire; and the conquetts they undonibtedly made in our illand are cer tain proofs of their valour.

The matural entmies of the Danes were the Sweder, Nowegians, and Saxons; cfpecially the ferf. With one or other of thefe nations atmol perpetual war was carricel on. 'The kingdom was alfo often reat by civil diffentions; which the neighouring monarchs did not fail to take advantage of, in order to reduce the kingdom of Denmark uader their fubjection. As ocither paty. however, gencrally came off with advantage, the hiftory of the fe wars affords mothing interelling or entertanang. One of the greatell of the Danim monarchs was I cadome $I$. who obtained the therone in videmate. 1157, haviny defeated and kiled his competitor Suen, a se eat moo after a ten years civil war. Ie maintained a long was narch. with the Vandals, whofe power he at latl antively broke, and reduced under his fuljection the ifland of Ragen. Healfo proved victorions over the Narnegians, fo that ther kirg and qucen came in perfon to fabmit to him. In 1 it 5 , he alfo laid the foundations of the city of Dantric : which, though it hath lince become a place of fuch confequence, confited at firl only of a few poor fithermens huts; but the prisileges and immmitics conferred non it by this monarch, foon proved the mans of its becoming a flourithing 5 C
city.

## D E N [754] D E N

Derant k eiry. - In 1160 , be entirely fubdued the Courianders; and, foon after, was invefted with the duchy of Holitein, by the emperor Frederic Barbaroff. He is faid to have been poifoned by a quack medicine, given with a defign to recover him from a diftemper with which he was feized in 1182.

In the year 1195, Canute, Valdemar's fuccefior,

Puwer of Denmatk in 1195.

6 Expedition of Vraldemarll. $\mathrm{m}^{-}$ gait ft the Eivoniars. caufed a mufer to be made of all the men fit to bear arms in lis dominiuns; and ordeied each province to fit out its proportion of hipping, every way equipped, and ready for action. The whole force of Denmark, ax that time, confifed of 670 hips of war, befides the fyustrons fupplied by vaffals, tributary fates, and allies. The number of the land-forees is not mentioned. In the reign of this prince, the Dinilh dominions were enlatged by the entire conquett of Stromar ; the difriets of Lubec and Hamburerh, formerly koown hy the nanme of Norclabingia, but now included ander the general name of Hollein. He died in 1203, and was fucceeded by Valdemar II. who proved a very great and warlike prince. In 12:1, he founded the city of Stralfund, oppofite to the Ine of Rugen. The fame year his queen died in child-bed; and in memory of her he built the catle of Droningholm, that name importing the 是ucerns-ffund. In 1218 , he undertook an expedition again!t the Livonians, having received advice that thoy, affited by the Lithuanians, Mufeovites, and other babarcus nations, had driven from their habitations all thofe in their neighbourhood who had cmbraced Chridianity, and taken an oath of allegiance to the crown of Denmark. Fitting out a powerful flect, therefore, he immediately fet fail for that country; but his troops were no fooner landed, than they were feized with a panic at the fight of fuch a powerful army of favages as were affembled oo oppofe them. The king limfelf was difmayed at the unufual feectacle of a whole army clothed in ithins, and refembling bealts more than human creatures. Encouraged, however, by the bihops who attended him, he ventured an engagement, and overthrew the barbarians with incredible flangter. This victory was gained near the fortrefs of $\bar{r}$ aldemar, which receised its name on that account.

How potent and thourilhing the kingdom of Denmatk was at this time, appears from an efimate of the revenues of the tributary provinces, thofe countries conquered by Vademar, and the fanding forces of the whole kingdom. This account was copied by Pontamus from Witfeld a writer of thofe days, who had it from a regiter kept by Valdemar's lleward. From the provinces were daily fint in 24 lalls of oats, 24 lafts of rye, and half that quantity of wheat, 13 talents of cheele and butter, and nine of honey; 24 oxen, $3=0$ fheep, 200 hogs; and 600 marks of coined money. This was the certain revence: hut to this was added near an equal fom from adventitious circumfances; fuch as fnés, forfeitures, taxes on law-fuits and pleadingr, with a varicty of other contingencies; the whole ancunting to upwards of $1,0,000$ marks a-day, or 22,730,0col. fir aunzm; a lum in thofe days almot incredible. With this revenue were kept for conllant fervice 14 ro great and fmall Thips for the king's ufe, each of which at a nedimm carried 121 iuldiess; making the whole of the thanding forces, betidesgatrions, confit of 165,900 fighting men.

In 1223 , a very greac misfortune bef. 1 Valdemar,
notwithlanding all his power. Henry earl of Swerin, Denmak. otherwife called Henry Palatine, a German prince, ha- ving been deprived of part of his cominions by Valde- ${ }^{\text {s }}$
mar, furprifed and carried off the king himfelf, and eaken primar, furpricd and carried of the king hmelf, and eaken pritions on which he at laft obtained his liberty were very 9 9 hard. He was ohliged to pay a prodizious fum of Releafed nr money; to relinquih Holltein, Swerin, Hamburgh, condition or and all his pofertions on the other fide of the Elbe; ceding part and lafty, folemnly to fwear that he would maintain of hisents. this compulfise contract, and never take any meafures to punifh Heary or his atociates. This treaty was figned on the 2 gth of March 122 万.

Belides theie tervitories which the Danih monarch had been obliged to cede by treaty, many tributary princes took the opportunity of his capcivity torecover their liberty; and among the ret, the inhabitanis of Lubec revolted, and entered irto alliance with Albert duke of Saxony againt Vaidemar. Ttae latter, however, was not of a difpofition to fubmit tamely to fuch treatment. He obiained a difpenfaticn from the He breaks Pope to break his engagments with Henry, and im. mediately entered Holitein at the head of a numerous army. Here he was met by feveral German p.inces, at the head of a very numerous army; and a delperate engagement enfued. Valdemar at firft had the advantage; but beng wounded in the eye, his troops une at lait defeated with great flaughter. It doth not appear that ever the king of Denmark was able to rerenge himfulf of his enemies, or to recover the dominions he had loft. So far from this, he was obliged, in 1228 , to cede Lawenberg to the duke of Saxony, who had already fei\%ed on Ratzburg and Molna. Soon after this, his eldeft fon Valdemar was aceidentally kitled as be was hunting, and his two other fons married the daughters of his two greatelt enemis. Abel, the third fen, married the daughter of Adolphus duke of Holtein; and Eric, the fecond, marricd rhe duke of Saxony's danghter. 'Thefe misfort unes are fuppofed to have haftened his death, which happened in the month of April $124^{2}$.

On the death of Valdemar, the kingdom u*s divided between the two young princes; and between them a war conmenced the very next year. A peace was concluded the year following, and war renewed the yearafter; kut how long it continued, we are not informed. In 125 , Eric paid a vifit to his brother Abel, intreating his mediation betweeu him and the prinees of Holltein, with whom he was then at war. Abel received him, in appearance, with great kindnets, and promifed that his utmolt endeavours to procure a reconculiation thould not be wanting ; hut in the mean time, laid a plan for having him murdered at fea : this was effected, and Abel became mafter of the whole kingdom.

The new king did not long erjoy the fovereignty Kingtons he had fo welcedly obtained. He was termented ty davoded a his own confcience; efpecially when he found among number of his brother's papers, one by which he was left heir to perty tythe whole kingiom on the deceafe of Eric, and many ran.s. kind expreffors with regard to himfelf. He was at lat killed in a battle with his own fubjects in 1252, on account of fome taxes he intended 1.0 impolie.

From this time to the year 1333. the kingiom of Denmark gradually declined. Ufapers eftahlifhed
denmark themflves in different provinces; while the kings of Sweden did not fail to ivail thenfelves of the dittracted flate of the Danilh affairs. In ${ }^{3} 333$, died Chriftopher II. who poffeffed only the cities of Scanderburg in Jutland and Ncoburg in Fionia, with fome few other inconfiderable places, of all the hereditary dominions of Denmark. Halland, Holbec, Calemburg, and Samfoe, were held by Canute Porfius; Schonen, 1.y Are, and Bleking, by the king of Sweden, to whom they had been lately fold: 'John carl of Wagria had the jurifdictions of Zealand, Fallre, Laaland, and Femerin: Gerhard, of Jutland and Fiomia; and Lawrence Jonea, of Lang-land and Arras.

Afice the death of Chriftopher, an interregnum of feven years enfued.-The firlt attempt for the forereignty was made by Otho, fecond fon to the late king, who laid a fcheme for driving Gerhard out of Jutland; but not being able to accomplifh it, he was taken prifoner, and clofely confined by Gerhard.-The king of Sweden next wrote to Pope Penediat XIII. befeeching his Halinefs to contirm to him the provinces of Schonen ard others which he poffefed ; and to allow him to fubdue the rett of the kingdom, which was now ufurped and rendered miferable by a fet of petty princes, who knew not how to govern. To influence him the more powerfully, he alio promifed to hold this kingdon of the Pope; and to pay him the ufual tax collected by the church. This requel, however, was refufed. Valdemar of Slefwic, nephew to Gerhard, then alpired to the fovereignty. He had formoly been elected king; but had given over all thoughts of enjoying the fovereignty, on account of the fuperior influence of Chrillopher: but now refumed his ambitions views at the intigation of his uncle. Several of the nobility alfo calt their eyes on young Valdemar Chriftopher's fon, now at the emperer's court. But while each of thefe princes were laying fchemes to aggrandife themfelves, the unhappy Danes were diftreffed by exoroitant taxes, famine, and peftilence; the two lalt in confequence of the former. The peafants neglected to cultivate the lands, which they held on a very precarious tenure; the confequence of this was poverty and an unwholeforne diet ; and this, co-operating with the peculiar difpofition of the air, produced a plague, which deftroyed more than half the inhabitants of the counnry. The poor dropped down dead on the ftreets with difeafe and hunger, and the gentry theinfelves were reduced to a thate of wretchednefs; yet, though the whole kingdom was evidently on the verge of ruin, ambitious projects employed the great, as if every thing had been in the mott profound tranquillity.

In the midit of thefe grievous calamitics, Gerhard, fovereign of Jutland, propoled to his. nephew Valdemar an exchange of territories, which he believed would prove favourable to the delggas of the latter on the crown. A reaty for this purpofe was actually diawn up and figned; but the inliahitants, notwithlanding their diftreffed fituation, fo highly, refented their being difpofed of hike catte, from one mafter to mother, that they refufed to pay the ufinal taxes. Gerhard refolved to compel them; and therefore led to,000 inen, whom he had levied in Germany, into the licart of the province. Ptovidence, howeser, now raifed up an enemy to this tyrant. One Nicholas Norevi, a man greatly
efteemed for ihis courage, public ipisit, and pradence. Deamark. beheld with forrow the condition to which Denmark was redaced. He had long meditated a variety of Nithol projects for its relief, and at laft imaterined things were Nothovis rea in fuch a fituation that the whole depended on his fingle envers the arm. Young Valdernar, Chriftopher's fon, had a num - Llerery of ber of adherents in the kingdom; his moft dangerous Juthand. cnemy was Gerhard; and could he be removel, the Jutlanders wonld at leait be free from an "ppreffor, and might choofe Valdemar, or any other they thougbr proper, for their fovereign. Collecting a body of chofen horfe, therefore, he marched in the night to Randerthufen, where Gerhard had lixed his head quartes 5 : and having forced open the tyranc's quarters, immediately put him to death. He then fed with the utmolt expedition ; but was purfised and overtaken by a party of the enemy's horfe, through which he force 4 his way and efcaped. Gerbard's fons hearing of his death, retired into Holltein from whence they lind come; leaving the army, compofed chiefly of HolAeiners, to be cut in pieces by the enraged pealanes, who fell upon them from every quarter.

Still, however, the Holfeiners kept poffeffion of tia: citadels and fortified places, from whence Nichelas refolved to diflodge them. He accordingly raifed a body of forces; attacked and took Landen, a cafte lituated on the river Scherne: After which be laid fiege to Albeg; but the garrifon making an obitinate defence, he turned the fiege into a bluckade, by which they were foon reduced to great extremity. The governor fent an exprefs to the fons of Gerhard, acquainting them with the impofifibility of his holding nut more than a few days, withort being reliovet. This determined them to march to the reli if of fo im portant a place. They came up with Nichoias jut as he ${ }^{15}$ : k .! the governor was ready to furrender, but were defeat-ch. ed; though Nicholas was unfottunately killed in the engagement.

Juiland having thus regained its liberty, the relt of the kingdom followed its example. Zealand firt openly declared itfelf. Here Heary, Gerhard's fon, maintained feveral garrifons; and iefolved to defend his poffeffions in fite of all the power of the inhabitants. For this purpofe he drew together an army ; but, in the mean time, a tumult arofe among the peafants on account of a Danilh nobleman hain by the Holteiners. By this the people were at lafl fo irritated, that falling upon the Holtteiners iword in hand, they killed 300 of them, drove the sent out of the illand, and chofe Valdemar, Cluritopher's fon, for their fovereign.

The Danes :ow refumed their courage ; the hads were cultivated, the famine and peftilence ceafed, and 16 the kingdom began to flourifh as formerly. Matters Margaren continued in a profperous way till 1387 , when Mar- untes the garet mounted the throne. Sthe raifed the kingdom to trowns if its highelt pitch of glory, as partly by her addrefe, and swermic: partly by hereditary right, the formed the union of \%h: :3:Calnar, by which the was acknowlelged fovereign of (wa).
Sweden, Denmark, and Nurway. She held her dignity with fuch firmneis and conare, that fhe was juthby lyled the Semiramis of the Nerth. Henmark. crown of Denmark fell to Chritian count of Oldenburg, fiom whom the prefent royal family of Denmark is deir-nded : and, in 1536 , the Proteftant religion was eflablifhed in Denmark by that wife and politic prince Chritian $11 \%$.

Chrihian IV. of Denmark, in 1629, was chofen for the head of the Proteftant league formed againlt the boufe of Aufria: but, though hrave in his own perfom, he was in danger of lofing his dominions; when he was fucceeded in that command by the famous Guflawns Adolphas, king of Sweden. The Dutch ha ving obliged Chritian, who died in 1648 , to lower the daties of the Sound, his fon Frederic III. confented to accept of an anauity of 150,000 florins for the whole. The Dutch, atter this, perfuaded him to declare war againt Chartes Gullavus king of Swe len, which had alnont cof him his cruva in 1657 . Cbatles formed the furtefs of Fredeticitadt ; and in the fucceeding winter, he marched his army over the ice to the ifland of Funen, where he furprifed the Danilh troops, tonk Olenfee and Nyburg, and marched over the Great Belt to befiege Copenhagen itfelf. Cromwell, the Englin wfurper, interpofed: and Frederic defended his capital with great magnanimity till the peace of Rofehind; by which Frederic ceded the provinces of Halland, Bleking, and Sconia, the ifland of Bornholm, Bahus, and Drontheim, in Norway, to the Swedes. Frederic fought to elude thofe fevere terms; hut Charles took Cronenburg, and once more lefieged Copenhagen by fea and land. The feady intrepid conduEt of Frederic under thefe misfortunes endeared him to his fubjects; and the citizens of Copenhagen made an admirable defence, till a Dutch fleet arrived in the Baltic, aud beat the Swedith fleet. The fortune of war was now entirely changed in favour of Frederic, who thowed on every occation great abilities, boch civil and miliary : and having forced Charles to raife the fiege of Copenhagen, might have carried the war into Siveden, had not the Engliih fleet, under Montague, appeared in the Baltic. This enabled Charles to befiege Copenhagen a third time: but France and England offering their mediation, a peace was concluded in that capital ; by which the ifland of Bornhalm returned to the Danes; but the ifland of Rugen, Bleking, Halland, and Schonen, remained with the Swedes.

18

## Remarie-

 able revolution, hy which the king is rendered abfo-lute.

The year 1660 affords us an example of a revolution almolt unequalled in the annals of hiltory, viz. that of a free people refigning their liberty into the hands of their lovereign, and of their own accord, and without the leaft compulfion, rendering him defpotic. This was occafioned by the great charecter which Frederic had aequired by his prident and valiant conduct when Copenhagen was belieged by the king of Sweden ; and at that time he had alfo taken care to ingratiate himfelf with the conmonalty, by obliging the nobility to allow them fome immunities which they did not enjoy before; allowing them alfo, by a fpecial edict, to poffers lands, and enjoy all the privileges of nobility. After the conclufion of the treaty with Sweden, a diet was fummoned at Copenhagen, to take into con! deration the date of the kingdom, which was now very much exhnufted, both by reafon of the debts in which it was involved and by the calamities of war. 'This diected Rate of affairs was, by the commons, at-
tibuted to the nobility ; who, on the orher hand, took Denmark. no care to conciliate the affections of the inferior claffes, but rather increafed the difcontents by their arsogance. 'They had even the impradence to remond rate againft the immunities above mentianed, which had been granted by the kino during the frege. In condequence of this the deplites of the commons and elergy united againt then; and being juned by the citizens of Copenharren, formed a wiry conblerable party. On bringing forward in the afiemtly the fans necellary for the national exigencies, a general excife was propofed by the nolates on every article of contimpt; and to which they themfives were willing to fubmit, though, by in expreis law, their order was to be exempted from all taxes. This offer was acco rpanied with a remontrance to the king; in which they endeavoured not only to reclaim many oblolete privileges, but to add freth immunties, and introduce many other regula. tious, ell of them tending ta diminih the royal prerogative, and check the rifins infuence of the commone and clergy. This propolal necafioned great difputes in the diet; and the two inferine orders infifted that they would not adnit of any tax which thould not be levied equally upon all ranks, without referve or reftriction. The nobles not only refufed to comply with this propofal, but even to be fubject to the tax for more than three years; pretending that all taxes whatever were infringements on their privileges. By way of compenfation, however, they propofed new duties upon leather and Atamped paper, and at laft offered to pay a poll-tax for their peafants. This exchange feemed at firft to be agreeable to the two inferior eltates; but they fuddenly altered their mind, and demanded that the fiefs and domains, which the nobles had hitherto polfeffed exclufively, and at a very moderate rent, fhould ne let to the higheil bidder.

Such a propofal apzeared to the nobles to be to the laft degree unreafonable. They faid it was an infraction of their deareit privileges; as, by the 46 th article of the coronation oath taken by Frederic, the poffeffion of the royal fiefs was guaranteed to their order; but, in the heat of difpute, one of the chief fenators baving imprudently thrown out fome reproachful exprefions againlt the commons, a general ferment enfued, and the afiembly was broken up in confuffon. This gave occalion to the interpofition of the king's friends; and an idea of rendering the crown hereditary, and enlarging the royal prerogative, began to be fuggefted as the proper method of humbling the sobility. This was tirit broached by the bithop of Zealand, at whofe houfe a numerous meeting was held on the 6th of October 1650, where the fcheme was fully laid open and approved; an act for rendering the crown hereditary drawn up; and the beft method of puhlicly producing it taken into confideration. All this time the king feemed quite inactive, nor could he be prevailed upon to take any part in an affar which fo nearly concerned him. But this indolence was abundantly compenfated by the alertnefs and diligence of the queen; between whom and the heads of the party matters were foon concerted. On the morning of the 8th of Octuber, thetefore, the bilhop of Zealand having obtained the conlent and fignature of the ecelefiaftical deputies, delivered it to Naufen burgomaller of Copenhagen and feaker of the commons. The latict, in a moll perfudive

## 

Denmark. fuafive fpeech, expatiated upon the wretehed flate of brought their defign to perfection, and he andd re- Denmare. the kinglom, the oppreffive power of the nobles, and the virues of the king; concheding with an exhortation to the commons, to fubreribe the act as the only means of faving their connery.

Thise exhontations of the fpeaker had fuch an effect upen the affably, that they febicribed it without a fingle diffent; the nobles being all the while in perfect fecuricy, and entively ignorant of the tanfation. Next day it was prefunted to the king hy the biflop and Naufen; and as they were returning from the palace, they met the fenator who had already given offence to the eummons. With him they had a vioknt al tercation, and were threatened with impuifonment for peffuning to approach the king without acquanting the order of mobles. This threat was now altagether nagatory. The nubles having gor fome intellifonce of what was gring forward, had jutt affembled in order to comider of what was to be done, when the deputies of the two other effates entered, and informed them of their proceedinge, and delivered to them the propofil for rendering the crown hereditary. By this declaration the nobles were thrown into the utmoft conflemation but judging it improper to put a negative on the pupofal at prefent, they ondeavored to grin time, and replied, that thoug! they willingly gave their affent to the decleration, yet that, as it was a matter of great confequence, it deferved the moll farious difcuffion. Naufen, however, replied, that the other eltates had already taken their refolution; that they would lofe no time in debate; and that if the nobles would not concur with them, they would immediateIy repair to the palsee by themfelves, where they had not the leaft doubt that the king would gracioully acespt their proffer.

In the mean time the nobles had privately difpatehed a meffage to the king, intimating, that they were willing to render the crown hereditary in the male line of his iffue, provided it was done with all the ufual formalities. Liut this propolal did not prove agreeatle to his majethy, walds they would confirm the right of fucceffion in the female lize alfo. He added, however, with great appeanance of moderation, that he by no means wifhed to prefcribe ulules for their conduct; they were to follow the diftates of their own judgment; but as for his part, he would owe every thing to their free confent. While the nobles were waiting for this anfiver, the other deputies, perceiving that they wifhed to keep the mater in fufpence, hof all patience, and repaired in fulemn procefion to the court; where, being admitted into the royal prefence, the matter was opened by the tifhop of Zealand. He addrefted his majefty on the refolution taken by the clergy and commons, offeting in their name to render the crown hereditaly, and to inveft him with abfolute authority; adding, that they were ready to facrifice their lives in the deff nce of an eftablifhment fo falutary to their comntry. His majefty tha:aked them for their favourable intentions; but mentioned the concurrence of the nobles as a neceflary condition; though he had no doubt of this when they fhould have time to accompany the declaration with all the neceffary formalities ; he affured them of his protection, pronifed a redefs of all grievances, and difniffed them with an exhortation to cominue their fittings until they houid have ceive their voluntary fubmifinn withall due folemnity.

On departure of the commons from the place where they had been conferrine with the robles, the latter had been fodillacted and confnicd, that they broke up without coming to any refolation, defignins, however, to decide the matter fisally at their meeting on the afternoon of the following day. But while they were thus waveriag and irneflute, the coust and the popular paity tuck the neetfary meaflares to force them to a concurience. 'I'his was effe\{ually done by an order to that the gates; for by this they were for buch difpirited that they indantly difpatched deputirs to the court, with a meflage that they were ready to conenr with the commons, and iubicribe to all the conditions of the royal pleafure.

Nuthiag how remained but to ratify the tranfaction with all proper folemnity. Accordingly, on the 1 oth. of October, ile eftates annulled, in the mot folema manner, the capitulation or charter figned by the kins on his aeceflim to the throne; ahfolved him from all his engasements; and cancelled all the limitations inpofed upon his tovereiznty. The whole was concluded by the ceremony of doing homage, taking the new oath with great ceremozy; after which a aew form of government was promulgated under the bitle of The Rovel Law of Dermark

Frederic was fucceeded, in 1670 , by his fon Chinitian V. who obliged the lutic of Holttein Gottorp to renounce all the advantages he had gained by the treaty of Rolchild. He then recovered a numberof places in Schonen; but his army was defeated in the bloody battle of Luaden by Charks KI. of Sweden. This defeat did not putan end to the war; which Chriftian obftinately continued, till he was defeated entirely at the battle of Landferoon; and he had almot exhaufted his dominions in his military operations, till he was in a manner abandoned by all his allies, and foreed to fign a treaty on the terms preferibed by France, in 1679 . Chrillian, however, did not defilt from his military attempts; and at laft he became the ally and fublidiary of Louis XIV. who was then threatening Europe with chains. ChriAian, after a valt variety of treating and figtiting with the I-Iolkeiners, Hamburghers, and other northern powers, died in $16 y 9$. He was fucceeded by Frederic IV. who, like his predeceffors, maintained his pretenfions upon Holkein ; and probacly mult have become maller of that duchy, had not the Englifh and Dutch fleets raifed the fiege of Tromingen; while the young king of Sweden, Charles X1L. who was no more than 16 years of age, landed within eight miles of Copenlagen, to affit his brother-in-law the I)uke of FulAtein. Charles prubably would have made himfels mafter of Copenhagen, had not his Danith majelty agreed to the peace of Travendaht, which was entircly in the Duke's favour. Ey another treaty concluded with the States-General, Frederic obliged hiahelf to fornifh a body of troofs, who were to be paid by the confoderates; and who afterwards did great Eervice againk the French.

Notwithitanding this peaca, Frederic was perpetual. Pe prs at ly engaged in wars with the Sivedes; and while Churlos war- wath was an exile at Bender, he matched throught Holthein that bith $g^{-}$ into Swedifh Pomerania; and in the year 1782 , into Eremen, and took the city of Side. His troops,

Denmark. however, were totally defeated by the Swedes at Ga---mide dedith, who laid his favourite city of Altena in athes. Frolerie revenged himfelf, by feizing great part of the ducal Hultein, and forcing the Swedifh general, count Steinbock, to furrender himfilf prifoner, with all his troopz: In the year 1716, the fuccefles of Frederic were fo great, ly taking Tonningen and Stralfand, by driving the Swedes out of Norway, and reducing Whimar and Pomerania, that his allies began to fufpect he was aiming at the fovereignty of all Scandinavia. Upon the return of Charles of Sweden from his exile, he renewed the war againf Demark with a molt embittered fpirit ; but on the death of that prince, who was killd at the hege of Fiederichal, Frederic durft not refufe the offer of his Britannic majefy's mediation between him and the crown of $S$ seden; in confequence of which, a peace was concluded at Stockholn, which uft tim in polftion of the duchy of Slefwic. Fie. derie died in the year 1730 , after having, two years before, feen his canital reduced to athes by an accidental fire. His ion and furceflor, Chrittian Fredesic, made no other ufe of his power, and the advantages with which he manted the throne, than to cultivate peace with all his neir-hbours, and to promote the happinefs of his fubjecto, whom be cafed of many opprefive taxes.

In $173+$, after guarantecing the Pragmatic Sanctiont, Chriftian fent 6000 men to the allitance of the emperor, during the difpute of the fuccefiion to the crown of Poland. Though he was pacific, yet he was jealous of his rights, cipecially over Hamburgh. He oblized the Hamburghers to call in the mediation of Pruftia, to abolifh their bark, to admit be coin of Denmark as current, and to pay him a nillion of tilver marks. He had, two years afier. viz. 1938 , a difpute with his Britannic majefty about the little lordhip of Steinhort, which had been mortgaged to the latter by the Duke of Holltein Lawenburg, and which Cariftian faid belonged to him. Some blood was fpilt during the contell ; in which Chriltian, it is thought, never was in earnett. It brought on, however, a treaty, in which he availed himetit of his Bri. tannic majety's predilection for his German cominions; fur he ayreed to pay Chriftian a fubfidy of 70,000 . Sterling a-year, on condition of keeping ia readinefs 7000 troops for the proportion of Hanover: this was a gainflel balgain for Demmark. And two years after, he feizel fome Dutch thips for trading withont his leate to Iceland: but the dificrence was made up by the mediation of Sweden. Chritian had togreat a party in that kingdom, that it was gencrally thought he would revive the union of Calmar, by procuriag his fon to be declared fueceffor to his then Swedin majelly. Sume fteps for that propofe were ertainly taken : hut whatever Chrilian's views might have been, the detign was fruftrated by the jouloufy of other powers, who could not bear the thoughts of feeing all Scandinavia fuljeet to one farmily. Chritian Bied in $17+6$, with the charaker of being the father of has pesple.

Ifin fon and forcefing, Frederic V. had, in 17t?, rasried the priacefs Lonifa, daysher to his Britanaic majeity. He in proved upon his fatler"s phan for the

cept that of a mediator, in the German war. For it Denmark, was by his intervention that the treaty of $\mathrm{Cl}, \mathrm{tter-fe}-\mathrm{C}_{\text {- }}$ ven was concluded between his royal bighnefs the late duke of Cumberland and the Frencl general Richelien. Upon the death of his firt queen, who was mother to his prefent Daiaih najefty, he married a daughter of the duke of Erunfwic Wolfenbuttel; and died in 1766.

He was fuecseded by his fon Chritian VII. his prefent Danih majelty, who married the princefs Carolina Matilda of England. But this alliance proved ex- ${ }^{21}$ tremely uafortunatc, which is generally afribed to of the the intrigucs of the queen dowager, mother-in-law to dowager the priemt king. She is reprefented as ambitious, and misfor of areful, and defigning ; and as one who wifhed to have the young fet afide the king himielf in favour of her own fon Fre-q .ecu. deric. On the arrival of the young queen, however, the received her with much apparat affection, telling her the faults of herthuband, and at the fame time promiling to affit her on all occations in recidiming him from his vicious courfes. Thus, under pretence of kindnefs and frendhip, fee fowed tle feeds of difiention betwixt the royal pair before the unfertunate princefs had the leatt iufpicion of her danger; and while the unthinking queen revealed to the dowager all her fecerts, the latter is faid to have placed fpies about the king to keep him conitantly engaged in riot and debauchery, to which he was at any rate too much inclined. At lait it was contrived to throw a miftrefs in lis way, whom he was advifed to keep in his palace. -It was impofitible that any woman could pais fuch a picce of conduet unnoticed; however, in this affair, the queen dowager behaved with her ufual duplicity. In the abfence of the king fhe pretended great refentment againt him, and even advifed the queen not to live with him; but as foon as he returned, when his confort reproached him, though in a genle manner, with his conduct, fhe not oniy took his part, but infitled that it was prefumptuous in a queen of Denmark to pretend to direct her hulband's conduct. Nutwithfanding this incendiary behaviour, the queea waz in a thort time reconciled to her hufand, and lived on very good teras with him until fhe again excited the jealoniy of the dowager by affuming to lerfelf the direction of that part of the public affairs which the dowager had hecen accultomed to look upon as her own privilege. For fome time it feemed to bedifficult for her to form any effectual flan of revenge, as the king liad difplaced feveral of her friends who had for fome time had a fiare in the adminiftration. Two new favourites, Biandt and Strucnfee, had now appearCd; and as thefe paid great court to the queen, the dowager took occalion to indinuate not only that the U'een was harlouring improper defigns with regard to the government, but that the had an intrigue with Siruentee. The new miniters indeed behaved imprudentiv, in attenapting to make a reformation in feveral of the departments of the flate at once, intlest of wating patiently until an opportunity hould ofier; and in theic precipitate fonenes they were certainly fupported by the queen. Thefe imlances of want of circumfection in the minifters, were reprefented by the dowager and her party to be a fettled fohene to make an alteration in the government; and a defign was even
ipokea

## D E N [ 759 ] D E N

Pennark. fpoken of to fuperfede the king as being incapable of governing, to declare the queen regent during the minority of her fon, and to make Struenfee prime minifter.

Thus a very formidable oppofition was formed againt Brandt and Struenfe ; and as the latter had made fome innovations in the military department as well as the civil, fome of the principal officers, who were the creatures of the dowager, reprefented him as defigning to oventhow the whole fyltom of govermane. When inatiess were brought to a proper beariug, it was at lalt refolued to forprife the kiug in the middle of the night, and force him inRantly to lis, n an onder which was to be ready prepared, for committing the obnowions purfons to feparate prifons, acrule them of high treafon in gencral, and partionlally with a dehgn to dethrone or poifon the kiag. If this conlld not be properly authertica:cl, it was determined to fuborn witneffes to confirm the repors: of a erminal currefpondence between the queen and count Struemfe. This defign was extouted on the mifht of the IGth of January $177^{2}$, when a mafied bull was given at the court of Demmak. The queen, aiter haring danced moft part of the night with count Struerfee, retired to her chamber about two in the morning. About four the fame moruing, phinec Fiederic got up, and went with the queen dowager to the king's bed-chamber, accompained by general Eichfedt and count Ranzzau. Having corderd the king's valet de chambre to awake him, they informed his majelly that the queen, with count Strucnfee, his brother, and Braudt one of the new miniters, were at that moment bufy in drawing up an act of renmeiation of the crown, which they would immediately after compll him to fign ; and therefore there was a neceffity for him to give ainolder for their arreftment. The king is fail:o have heftated for fome time, and inclined to refufe this icandalous requifition; but at length, through importunity, and, accurding tofome accornes, beingeven threatened into compliance, he confented to what they required. Count Rantzau was difpatched, at that untimely hour, into the queen's apartments, and immediately executed the orders of the kinc. The unfortunate princtfs was conveyed in one of the king's coaches to the calle of Cronenturgh, together with the infant princefs, attended by Lady Moltyn, and efooted by a party of dragnons. Struenfee and Bandt were feized in their beds and imprifoned, as well as feveral uther members of the new adminititation, to the number of 18 . The queen dowager and her adhe enta feemed to aflume the governmententirely into their own hands, and a total change took place in the departments of adminiftration. The prince royal, fon of quen Matilda, then in the fifthyearof his age, was put untice the care of a lady of quality, who was appointed governefs, under the fuperintendency of the queen dowager. Sitruenfee and Brand were put ia truns, and v ery feverely treated: they underwent hone and fre22. quent examinations; and Struenfer at laf confened that Execution he had a crimipadintercourfe with the queen. Poth the:r ofstreriec heads were fruck off on the $2 \%$ th of April; but many and Drandt. of their partifans were fot at liberty. The confurion of Struenfe is by many, and inded with to fmall degree of probability, fuptoted to lave bete extorted by fear of the torture, and to have no fumbatica in truth; but as no means were wied ty the courtuf Priainteclear up the queen's character, the affair nuft undoubtedly
wear a fuficious afpeet. At laf, howeter, his Br:- Dennazh. tannic majefty interfered fo far as to fend a fmall fyua. dron of thipg to convoy the unhappy princets to Germany. Here the city of Zell was appointed for her relidence; and in this place the died of a malignant fover on the roth of May 1775, aged 23 years and 10 months.

The inhoman treatment of this paincefs did not long prove advantagcous to the queen dowager and her 2 , party: A new revolution tonk place in Aprill 1784 , Chas : when the quten dowager's fiends were removed, athe alwis." new council was formed under the aufpies of the prince ftratin. royal, and no intlrument deemed anthentic unders beroed by the king, and comutertigned by the prince. Since that time, the king, whofrom the begiming "f hisadmintia. tion thowed a great desret of incapacity, has treen chatirely laid afide from rublic bufinefs, and has no thare in the gevernment. 'He Danesare at prefent engaged an the fide of Rufia in her war with the 'Purss, the immediate oppoment of I emmalis being iswede.
The kingdom of Denmark at prefent is divided into Divi.onno fix grand difticts or provinces; viz. I. Dinmark pro-the knyperly fo called, comprehending the illans of Zealond, dom. Funcı, Langland, Laland, Falitria, Mont, Sanfoc, Arroe, Bornhom, Anhoult, Leffaw, and that part of the continent called North Guthand. 2. The duchy of Slef:wick, or South Jutland. 3. The duchy of HolAtein. 4. The carldoms of Oldenburg and Delmenhort, 5. The kingdom of Norway; and 6. Iceland, with the illands lying in the Northern Seas; for a particeJar defeription of which fee thefe anticles.

The language of Denmark is a dialect of the Tur. 23 tonic, and bears a flong affinity to the Norwegian religun, tongue; but is difagreeable to flrangers, on account of cic. the drawling tone with which is is prononnced. They have borrowed many words from the German : and, indeed, the high Dutch is ufed in common difourfe by the court, the gentry, and the hurghers. The better furt likewife underfland French, and fipeak it huently. The Lutheran doctrine is univen fally embraced through all Denmaik, Sweden, and Notway; fo that there is not another tect in thete kingdom. Dennark is divided into fix diocefer, one in Zealand, oue in Funen, and four in Jutland: but the bithop; are, properly fpeaking, no other than fuperiutendants, or frimi intor pares. They have no cathedral, ectlefiattical courts, or temporalities. Their bulitefs is to infpect the doetrine and morals of the isfever elesgy. The revenue of the bithop of Copenhacen amounts $t$ o dboui 2000 ixdollars; and this is the sidheft bencfice in the kingdom. The clergy are wholly dependant on the government. They never intermedde, nor are em. ployed or confulted in civil affairs. They, nevertheleis, have acquired grat influence, and crefted a fort of firitual tyranuy seer the minds of the cummon people, by whom they are mulh weered. They are, renerally foeaking, nien of extmplary lives, and fome erudition.. Their charches are kept more dean, arut better adorned, than thrfe of Lughtad: the perple are great lovers of mufic, and thein organifts commonly ententain the congregation for laif an hour before or after fervice. The Atate of literature is very low in 1)enmalk. There is, indecd, an univerlity at Cogenhagen; but meanly cidowed, and very ill fuplied wioh matters. Tatte and the belles letres are miterly un. knowa in this country, which yet has froduced forae

## D E N [760 ] D E N

Sermant neen of great eminence in matlenatics and medicine;
26 Governnent. fuch as Tycho Brahe, Borrichius, and the Bartholines.
'The condlitution of Denmark was heretofore of the free Gothic original. The canvention of the edtates, even ind hing the reprefentatives of the boors or peafants, elcted a king for his perfonal virtues, having flill a regard to the fon of their late monarch, whom, however, they made no formple of fetting afide, if they decmed him unworthy of the myal dignity. They enacted laws; conferred the great offices of ftate; debated all affairs relating to commerce, peace, war, and alliances; and occafonally gave ibeir confent to the impofition of neceflary taxes. The king was no other than chief magiftrate, generaliffino, and as it were prime miniter to his people. His bntmets was to fie juftice adminifered impartially; to command the army in time of wat; to encourage induflry, religion, arse, and fciences; and to watch over the interefts of his fuhiects.

In 666 , however, the conftitution was new modelled, as has been alieady related, and which was to the following furport. "The hereditary kings of Denmark and Norway fhould be in effect, and oucht to be efteemed by their fubjects, the only fupreme head upcnearth; ther fall he above all himan laws, ard fall acknowledge, in all ecelefiaftical and civil affairs, no bigher power than God alone. The king fhall enjoy the right of making and isterpreting the laws, of abrogating, adding to, and difpenting with them. He may alfo anmul all the laws which either he or his predeceffors fhall have made, exceptirg this royal law, which munt remain irrevocable, and be confidered as the fundamental law of the !tate. He has the power of declaring war, makiag peace, impoling taxes, and lowing contributions of a! forts," \& c. Eic.

Then follow the regulations for the order of fucceffron, the regency in cafe of minority, the majority of the king, the mamenance of the royal family; and, after having enumerated all the polfible prerogatives of regal uneiremmferibed anthority, as if fufficient lrad not yet been laid down, it is added in the 26 th article: "All that we have hitherto faid of power and eminence, and fovercignty, and if there is any thing further which has not heen exprefsly fpecified, fhall all be comprifed in the flllowing words: "The king of Denmark and Niwway fhall be the hereditary monatch, and enducd with the highef authority ; infomuch, that all that can be faid and written to the advantacre of a Chriltian, hereditary, and ablolute king, hall be extended under the moll favourable interpretation to the hereditary king or queen of Demmank and Nor27 いay," sc. \&c.

The lawa of Denmark are faconcife, that the whole body is contained in one quarto volume, written in the language of the country. Every man may plead his own canle, without employing either comicl or attorncy: but there are a few advocates for the benefit of thole whon cannot or will not fpak in their own defence. 'Ihe proceedings are fo fummary, that a fuit may be caried through all the courts, and fimally decided, in 13 months. There are three courts in Denmark, and an appeat lies from the inferior to the fupesion tribsual. The lowet of thefe $i$ s, in cities and towns, denominated the $B_{i j f o t}$ tids Court; and in the country, the Herredsfousds. Caufes may be appealed from this to the Landlag, or general head court for
the province: but the final appeal lies to the court of Denmark. High right in Copenhagen, where the kine prefides in perfon, affited by the prime nobility. 'I'ne judges of the two other courts ane appointed by his majelty's letters patent, to fit and determine caules durate bene placito. Thefe are punifnable for any mildemean. ours of which they may be guity ; and when convicked of having paffed an unjult fentence, they are condenned to make reparation to the injured party. Their falarics are very incondrderable, and paid out of the king's treafury, from the fines of delinguents, beffides a faall gratuity from the plaintiff and defendant when fentence is paffed. Such is the peculiar privilege enjoyed by the city of Copenhagen, that caufes appealed from the Byfoglids court, inftead of paffing throush the provincial court, are tried by the burgomater and common-council; from whence thry procece imnediately to the bigheft court as the lift'refonce. Affairs relating to the revenue are determined in the rent chamber of $D_{\text {en }}$ mark, which is analogous to our court of exchequer. To another tribunal, compofed of fome members from this rent-chamber, from the adnisalty, and college of commesce, merchants appeal for redrefs, when their commorlities are feized fir non-payment if duties. All difputes rating to the fea are determined by the court of adinialty, conflituted of commifioners appointed for thete purpofis. The chancellary may be more pioperly termed a fecretary's office. It ennfilts of clerks, who write and iffue all the kincro dectees and citations, trancribe papes, and, acecrding to the directions they receive, make draughts of treaties and alliances with other nations. The government of Denmark is very commendable for the excellent policy it maintains. Juftice is executed upon criminals with great feverity; and fuch regulations are cftublified as efectually prevent thofe outrages that ane daily committed in other countries. No man prefumes to way his tongue againft the government, far lefs to hatch fchemes of treafon. All the fubjects ase, or feem to be, attached to their fovereign by the ties of affection. Robbery on the high-way, burgialy, coining or clipping, are crimes feldom or never heard of in Denmark. The capital crimes ufually committed are theft and manfaughter. Such offenders are beheaded very dexteroufly with one flroke of a fword. The executioner, though infamous, is commonly rich; becauie, over and above the functions of his office, he is employed in other feandalous occupations, which no other perfon will undertake. He, by meas of his undentrapper, called the fromor, empies all the jakes, and removes from houfes, table, or Areets, dead dogs, horfes, \&c. which no other Dane will vonchfafe to tourh on any confideration whatoever.

The Danilh nobility and gentry are all inched in Slavifh conthe term nodefe; and formerly there were no diftinc. dition of tions of title": but within thefe 60 or 70 years, forse the banif few favourites have been dignitied with the titles of count and baron. Thefe, and thele only, enjoy the privilege of difpoling of their ellates by will ; though others may make particular difpolitions, provided they have fufficient intereft to procure the king's approbation and fignaturc. The mobleffe of Demmark formelly lived at their own feats with great magnificence; and at the conventions of elates met the king with numerous and fuperb retinues: but fince he became abfolute, they are fo impoverifhed by exorbitant taxes, that they can
hardly

## D H

nenmark. hardiy procure fubfiltence; and, for the moft part, live obfeurcly in fome corat of their minced comatry palaces, unlefs they have intered enongh to procure fome employment at cont. 'They nolonget minerit the fuirit and virtuts of their anceltors: but are become fervile, indulent, ollentations, extravagant, and oppreffive.

Their seneral charaker is a Rrange compoficion of pride and meannefs, intolence and poverty. If any gentleman can find a purchafer for hisellate, the kine, by the Danith law, has a riglit to one third of the pur-chafe-money: but the lands are fo burdened with im. pofitions that there would be no danger of an alienation, even tho' this reftrition was not in force. Nay, fome gentlemen in the Illand of Zealand have actually offered to make a fursender to the king of lange tracts of very fertile land in the Mand of Zealind, if his maj.fty would be pleafed to aceept of them in place of the impotitions laid on them. The reafon of this is, becaufe, by the law of Denmak, if any citate is burdened beyond what it can bear, the owner muit nake up the deficiency ont of his other eflates, if he has any. Hence the king gencrally refufes fuch offers; and fome gentlemen have been tranfported with joy when they heard that his majefty had been "gracioully pleafed to accept their whole eftates."
this oppreffon of the nobles by the king produces in them a like difofofion to oppref the commons; and the confequence of all this is, that there is no part of the wolld where extiavagance and diffipation reigus to fuch a degree. The courtiers maintain fplendid equipages, wear fine clothes, drink a valt quantity of French wine, and indulge themfelves with eating to excefs. Sach as derive money from their employments, inftead wi purchafug land in Denmark, remit their cafh to the hanks of Itamburgh and Amileodam. The merchants and burchers tread in the iteps of their fuperiors: they fpend all their gains in lusury and pleafure, afraid of iacuring the futpicion of afluence, and being Itripped by taxation. The peafant, of hoor, follows the lame example. No fooner has he earned a rix-dollar than he makes hathe to expend it in brandy, left it thould fall into the hands of his opprellive landlord. This lower clafs of prople are as abfolute flaves as the negroes in the Welt Indies, and fubfit upon much harder fare. The value of eilates is not computed by the number of acres, hut by the fock of boors, who, like the timber, are leckoned a parcel of the freehold; and nothing can be more wrethed than the llate of thefe boors. They ieed upon ltoch-fifh, falted meats, and other coarle diet: there is not the leafl piece of furniture of any value in their honfer, except feather-beds, of which there is great plenty in Denmark; and which are ufed not only as beds to lie on but as blankets for covering. After the boor has toiled like a flave to raife the king's taxes, he mutt pay the overplas of his toil to his needy land. lord. Should he improve his ground and repair his farm-hovife, his crnel maller will immediately tranflant hinn to a barren farm and a naked habitation, that he may let the improved ground to anotho tenant at a hisher price. The peafants likewife fuftain a great deal of dimase and vialence from the licentions fuluiers that are quartered in the ir houfes. They are moreover ohliged to furnin horfes and waggons for the royal family.
and all their attendan*s when the hing mates a pro. Nemme. Fifs through the country, or removes his redidence foom one palace to arother. Oa fach oecations the neighouring boors are fummoned to afiomble wata their cattle and carriages, and not only to live at their owa expence, but to har every lpecies of onerafe fion the meanell hacequies of thofe who attend las majelty. The walike fpatit of the Danes no longer fubifts: the common people are mean-fpirited, fulpicions, and deceitful; not have they that talent for mechanics foremakable in fome northern nations. While the prafants are employed in their labour without doors, the women are occupied at home in fiming yan for limen, which is here made in great perfection.

In Demmark, all perfons of any rank above the vul- Dief, \&e. gar drefs in the lirench talte, and affect linery; the winter-drefs of the ladies is peculiar to the conitry, very neat, wam, and becoming. The common people are likewife remarkably neat, and pride themfelves in diferent changes of linen. They are very litte addised to jollity and divertion: their whole amufanchits conlitt in romning at the goofe on Slarove Tuctilay, and in winter in being drawn in ilces upon the ice. They aifo feaft and make merry at weddings and funcrals. With refpect to marriagc, the man and woman frequently colathit together on contrach lumg before the cercmony is performed. The nobility and genter pique themfetves on fumptuons burials and momments for the dead: the corpfe is very often lepe in a valut, or in the chancel of a charel, for fereral fears, hefore an opportunity ofters of celebating the funcral.

The tavorns in this country are poolly fopplicel: and he who diets in them mutt be contented to cat in a public room, unlefs le will condefoend to pay an co thavagant price for a private apartment. 'late metro. Pulis is but indifferenty fornithed with game. 'Tlos wid-ducks and plover are hardly eatatile; but the lares are good, and the maikets fonctimes probluce tolerable roebuck. Their fea-ith are nat to be commended; but the rivers produce plenty of delicious carp, perch, and craw-fifh. The gardens of the gentry are indl provided with melons, grapses, paches, and all lonts of arocen; and falads in perfection.

The amy of Demmark is compofid, fof the troops of Demaak and Holllein; and, 2. of Nomay:

The fores of Demmark and Holltein are divided Armos os into regulars and national or militia. 'Thete forces benitark. (the fout and horfe guards excepted who are all rerulars) are mot fepaatod, as in our army, into dillinct reciments, but are formed in the following manner: Before the late angmentation, every regiment of $\mathrm{i}_{\text {u }}$ fantry, when complete, condilled of 20 wifiects and 1632 priates, divided into ten companics of fuffer: and two of grenadiers. Of thele 1632 prinates, fiso, who are chiefly foreigners culited in Cenmany, are rerulars. The remaining 1152 are the wational militia, or peafints who refude upon the eftates of their landholders, each ettatefurnishing a certain'number in proportion to its salue. Thefe national troops are occafionally exercifed in fmall corps upon Sundays and holidiys; and are embodied once every yoar for about 17 days in their refpeotive dilkiats. Isy a late addition of ten men to ead company, a regiment of infantry is increafed to 1758 , inclading uticers. Whe exence of $51)$

hemuart each regiment, which before amounted to L. 6000 , has been raifed ty the late augmentation to L. 8000 . The cavalry is upon the fame footing; each regiment confitiag of 17 officers, inchuding ferjeants and conporals, and 565 privates, divided into five fquadrons. Of thefe abunt 260 are regrular and the remainder natonal troops. The reginents of foot and horle guards are regrulars; the former is compofed of 21 officers and 465 men, in five companies; and the latter of 7 officers and 154 men, in two íquadrons.

The forces of Norway are all national troops or militia, excepting the two regiments of Sundenfeld and Nordenfield; and as the peafants of that kingdom are free, the forces are levied in a different manner from thofe of benmark. Nonway is divided into a certain number of diltriots, each whereof furnithes a foldier. All the peafants are, upon their birth, regiftered for the militis; and the fin on the lif fupplies the vacancy for the diftrict to which he belongs. After laving furved from 10 to 14 years they are admitted among the invalids; and when they have attained the feniority of that corps receive their dimiffion. Thefe tronps are not continully under arms; but are only occafionally exurcifed like the national forces of Denmark. A fixed Atpend is aftraed to the officers, nearly equal to that of the officers in the regulars ; but the common fuhiers do not receive any pay except when they are in actual fervice, or performing their annual mancuvres. The Academy of Land Cadets, inltituted by Frederic IV. fupplies the army with officers. Aconding to this forndation, $44 \mathrm{ca}-$ dets are inftructed in the military feiences at the expence of the king. The whole amount of the Danifh troops is computed at (o, 200 .

From their infular fiturtion the Danes have always excelled as a maritione people. In the earlier ages, when piracy was an bonowable profefion, they were a race of pirates, and iffued from the Baltic to the conquelts of England and Normandy. And though, fince the improvement of navigation by the invention of the compafs, other nations have rifen to a greater degree of nasal eminence, ftill, hovever, the Danes, as they inhabit a clutier of illands, and poffefs a large tratit of fea-coaft, are well verfed in maritime affus, and are certainly the moft namerous, as well as the molt experienced, failors of the north.

The greater part of the Danith navy is lationed in the harbon of Copenhasen, which lies within the fort:fications: the depth of water being only 20 feet, the mips have not their lower ticr of guns on board, but hake them in when they get out of port. Befide large magazines, each velfel has a feparate dorehoufe on the water's edge, oppotite to which the is moored when in harbune, and may by this means be inttantly equipped. The number of regithered feamen are near 4, 000 , and are divided into two clafes; the firth comprife thofe inhabiing the coalls, who are allowed to engage in the fervice of merchant-fips trading to any part of the world. Each rectives Ss. annually from the crown as long as le funds a certiticate of his being alive; but is fubject to a recal in cafe of war. The fecond compretients the fixed failors, who are confanty in the employ of the crown, and amount to alout 4000 , auged muler four divinons, or 40
compuaies : they are fationed at Copenhagen fur the Denmarls, ordiant \{ervice of the navy, and work in the dock-

Dennis. yard. Each of them, when not at fea, receives 8 s . fer month, belide a fufficient quantity of flour and other provifinas every two years a complete fuit of chethes; and every year breeches, llockings, faces, and a cap. Some of them are ludged in barracks. When they fail, their pay is augmeated to zos. per month. The marine artillery confits of 800 men , in four divilions.

The whole navy confifts of 38 hips of the line, in. Navy cludines $)$ of $; 0$ guas and one of 44 , and 20 frigates; but if wee evcept thofe which are condemned, and thofe which are alloded unly for parade, we camot thimate that in 1779 the fleet confitted of more than 25 hips of the tine and 15 frigates fit for fervice; a number, however, fully adequate to the fituation of Demmark; and if we include the excellence of the failors, it mult be efteemed as complete a navy as any in the north.

The revenue of his Danith majuty arifes from taxes laid on his own fubjects; from the duties paid by foreigner, from his own eftate, crown-lands, and confifutions. The taxes are altogether arbitrary, and therefore fluctuating ; but they are always grievons to the fubject. They commonly confil of cuftoms or toll, for expont and import; of excile upon the confump. tion of wine, falt, tobacco, and all kinds of provilions ; of taxes upon marriages, paper, brewing, grinding, and the exercile of cifferent profellions; of impolitions on land, poll-money, ground-rent for all houfes in Copenlagen and elfewhere; of money raifed for maintaining fortifications, and for a portion to the king's daughter when the happens to be married: but this feldom exceeds 100,000 rixdollars. One comfundble artich in the revenue is the toll paid by forsign mips that pafs through the Sound, or Ore Sound (the Atrait between Schonen and Zealand), into the Baltic. This was originally no other than a fmall coniribution, which trading nations agreed to make for maintaining lights at certain places, to cirect their courfe throng the paffage in cark and flomy weather. At the fame time thefe trading nations agreed, that every hip fould pais this way and pay its fore of the expence, rather than ufe the Great Beit, which is the Gher pallege, but unprovided with any fuch conveniency. In procefs of time the Danes converted this voluntary contribution into an exorbitant tull, and even exacted arbitrayy fums, in proportion to the weaknefs of the mation whole fhips they vifited. Thefe exactions fomet imes iavolved them in quarels with their neighbours, and the toll was regulated in vepeated treatics.

DENNIS, or St Dennis, a famous town of the Ine of Fance, with a Benedistine abbey, whercin are the tombs of the kings of Franct, with a contiderable treafurc. E. Long. 2. 2G. N. Lat. 43. 56.

Dennis (Juhn), the celebrated critic, was the fon of a reputable tradefman in London, and born in the year $165 \%$. He received the tirf branches of education at the great fchool in Harrow on the Hill, where he commenced acquaintance and intimacy with many young noblemen and gentlemen, who afterwards made conflicrable figures in puolic affarr, whereby he laid the foundation of a very frong and exienlive interelt, which might, bui for his own fault, have been of inti-
the king of France woukd innt on his betag dubivered Denois. up, before he would confent to a peaca: and full of -and this idea of his own importance, when the congrefs was held at Utrecht, he is faid to have waited on his pa. tron the duke of Malborumgh, to delie that no fiach article might be tipulated. The dake told him be really had no intereft then with the miniftry; but had made no luch provition for his own lecurity, though he could not help thaking he had done the Frencio as much injury as Mr Dennis limfolf. Another fory relating to this affair is, that being at a gentleman's honfic on the coat of Suftex, and walking one day on the fea-hore, he fow a thip lailing, ab he fancicd, towaids him: he inllantly fet out for london, in the fancy that le was betrayed; and, congratulating himfelf on his sfeape, gave out that his friend had decoyed hime down to his houfe, to furrender him up to the French.

Mr Demis, partly through a natural peevifanefs and petulance of temper, and partly perhaps for the fake of procuring the means of fubfitence, was contimally cogaged in a paper-war with his cutemporaries, whom he ever treated with the utmott feverity: and, though many of his obfervations were judicions, yet lie ufually conseyed them in language fo fourritous and abulive, as deltroyed their intended effect; and as his attacks were almoll always on perfons of fuperior ablilitics to himfelf, viz. Addifon, Steele, and hope, their replies whatly turned the popular opinion fo greatly againf him, that, by irritating his telty temper the more, it rendered him a perpetual torment to himfelf; till at length, after a long life of viciffades, difappointments, and turmoils, rendered wretched by indiferetion, and hateful by malevolence, having outlived the reverfon of his eftate, and reduced to diftrefs, from which his having been daily creating enemis had left him fearcely any lopes of reticf, he was compelled to what matl be the mont ithfome finnation that can be conceived in human life, the receiving obligations from thofe whom he had been continually treating ill. In the very clofe of his dolys, a play was. acted for his benclit at the little theare in the Hay-market, procured through the united interetts of Meflrs 'Ihomfon, Mallet, and Pope; the laft of whom, notwithfanding the grofs manner in which Mr Dennis had on many ocealions ufed him, and the long warfare that had fublitted between them, interefted himfelf very warmly for him; and even wrote an oceafoonal prologne to the play, which wats fpoken by Mr Cibber. Not long after this, viz. on the Gth of Jannary 1733 , lie died, being then in the 77th jear of his age.

Mr Dennis certainly was poffefed of mucherudition, and a confiderable fhare of genius. In profe, he is far from a bad writer, where abufe or perfonal fourrity does not mingle itfelf with his language. In verfe, he is extremely unecqual ; his numbers being at fome times fpirited and harmonious, and his fuhjects elevated and judicious; and at others, flat, harh, and puerile.As a dramatic anthor, he certainly deferves not to be held in any confideration. It was juthy faid of him by a wit, that lie was the molt complete inflructor for a lramatic poet, fince he could teach him to dillinguih good plays by his precepts, and bad unce by his examples.

Semmina- DENOMiNitION (fecm denomino, of $d$ and notio, men, "a name;" a name inpofed on any thing, ufuFenses ally expediat fome quality predominant therein.
-. DeNOMiNitOR, in arithmetic, a term ufed in $f_{\text {Pe }}$ asing of fractions. Sce Apithmetic, $\mathrm{n}^{3} 21$.

DENSBITY of Bodrs, is that property direcly oppoite to rarity, whereby they contain fuch a quantity of matter under fuch a bulk.

Accordingly, a body is faid to lave donile or triple the denfity of another body, when, their bulk being equal, the quantity of matier is in the one double or :Hiple the quantity of matter in the other.

Dessitr of the Alir, is a property that has employed the later philofophers, fince the diforery of the Touricellian experiment.

It is demonilrated, that in the fame veffel, or even in veffels communicating with each other, at the fane difance from the centre, the air hasevery where the fame denlity. The deafity of air, catcris puriturs, increaies in proportion to the comprefing powers. Hence the interior air is denfer than the fuperior ; the denfity, however, of the lower air is not propurtional to the weigle of the atmofiphere on account of heat and cold, and other caufes penhaps which make great alterations in denity and ranity. However, from the elaticity of the air, its denfity innut be always different at different luights from the earth's furface; for the lower parts bing profed ty the weight of thofe above, will he made to accude nearer to cach wther, and the more fo as the weight of the incumbent air io greater. Hence the denfity of the air is greateft at the earth's furface, and decreafes upwards in geometrical proportion to the altitudes takea in arithmetical progreffon.

If the air be rendered denfer, the weight of bodiss in it is diminithed; if raver, increafed, becoufe bodies lufe a greater pari of their weight in denfer than in rater mediums. Hence, if the denhty of the air be fenfibly altered, bodics equally beavy in a rater air, if their Ipecific gravities be confiderably different, will lofe their equilibrium in the denfer, and the ipecifically Incavier bedy will preponderate. See Preumatics.

DENTALIUM, in natural hiltory, a theil-ifh belenging to the order of vermes teftacea. The thell confinls of one tubulons ftraight valve, open at both ends. 'Shere are eight fpecies, diftinguifhed by the angles, firio, \&c. of their hells.

DENTARIA, TOOTH-wort, or Tout-vidit: A genus of the filiquela order, belonging to the tetradynamia clafs of plants; and in the natural method ranking under the 39 th order, Siliquofu. The filiqua parts with a fpring, and the valvules roll fpirally backwards; the ftigma is emarginated ; the calyx clofing longitudi1, 2lly. There are three fpecies, all of them hardy perenni: Is producing annualfalhs 12 or 18 inches high, adorn(d) with many-lobed leaves, and fpikes of quadrupeta.uns cruciform Rowers of a red or purple colour. They delight in thady places: and are propagated either by feeds or parting the roots. The feeds may be fown Hautumn or early in the fpring, in a inady border of ligl.t earth; and when the plants are three inches ligh, they may be planted where they are to remain. Tlie time for parting the roots is in OEtober or Novomber, or early in the fpring.

DENTATUS (Curius), a renowned difinterehed Roman general, whofe vituss render tim more me-
morable than cren lis great military reputation, forurifhed 272 years B. C. He was thrice conful; he conquered the Samnites, $S$ sbines, and Lucanian; $;$ and gave each citzen to acres of land, altowing himblef no mere. The ambafadors of the Sammitea maki:g him a vifit, found him boiling turnips in a pipkiug; upon which they offered him gold to come over to their inturell ; but he tuld them, his delign was net to grow rich, bit to command thofe who were fo. He defeated I'yrhus near Tarentum, and reccived the honour of a triumph.
I)ENPELLA, in botany: A genus of the monogynia order, belonging to the pentandria clafs of plants. The calyx is a five-parted perianthium, with Ima! furbulated leaves; the flamina five floort fubulated filments; the anthere finall ; the pericarpium a glubular, bilucular capfule; the feeds egs-thaped, and very numerols.

DENIILES, or DENTILs, in architecture, an ornament in coraiches bearing fone refemblance to tecth, particularly uled in the Ionic and Corinthian ordery. See Archinicture.

DENIIFRICE, in medicine, a remedy for the teeth. There are varions kinds; generally made of eartly fubtances fincly pounded, and mixed with ahun, or foome other faline fubitances: but thele are pernicions, on account of their wearing away the enamel of the teeth : but more efpecially by the leptic quadlity with whiel thefe earthy fubltances are endowed. On this account, a portion of Peruvian bark fintiy pounded is now commonly added, which antwers the donble purpofe of cleaning the letth, and prierving then afterwardo from corruption.

DENTISCALPRA, in furgery, an inftument for fcouring yeilow, livid, or black tceth; to which being applied near the gums, it cerapss of the foul mortid crut.

DENTIPION, the breeding or cutsing the teeth is children. Sce (Imitrx fubjoined to) Medicise.

DENUNCIATION, a folemu publication or promulgation of any thing.

All veffels of emenies are lawful prizes, after denuaciation or proclamation of war. The defign of the dennuciation of excomnunicated perfons is, that the fentence may be the more fully execnted by the per. foin's being more known.

Denencistion at the Horn, in Seotslaw. See Law, Part liI. No clavi. If. $^{\text {. }}$

## DENYS (the Litile). See Dionysivs.

DEOBSTRUENTS, in pharmacy, fuch medicines as open obitructions. See Detergent.
DEODAND, in our cuftoms, a thing given or forfeitod as it were to God, for the pacification of his wrath in a cafe of mifadventure, whereby a Chitlian frol comes to a volent end, without the fault of any reafonable creature.

As, if a horfe frike his keeper and kill him: if a man, in driving a cart, falls fo as the cart-wheel runs over him, and preffes him to death : if one by felling a tree, and gives warning to the ftanders-by to look to themfelves, yet a man is killed by the fall thereof: in the firft place, the horfe; in the fecond, the cart-whecl, ca:t, and horfes; and in the third, the tree, is Dea dun. dus, "to le giveri to Goul," that is, to the king, to be diftributed to the poor by his alnoner, for expiation of

[^25]Deptheg- this dicadful vent; though effceted by irrationd, nay, mation, fentelds and deal creatuies.
Depilog
filuact
What moves to death, wrill. hum deach, in De watuand fucited.
This law fecms to be an imitation of that in Fixoches, chap. xxi. "If an ox gore a monn, or a woman, tith his homs, lo as they die; the ow thatl be tronel to death, and his flell not be eat ; to thath his owner be innocent."

Fheta fays, the Deodand is to be fold, and the patece ditributed to the poor, for the foul of the kids, his ancetors, and all faithfil people departed this life.

DEPHLECMARION, is an operation by which the fuperabundant water of a body is taken from it ; and it is principaliy eflected by evaporation or diltillation. Dephlegmation is alfo called concentration, parficularly when acids are the fubject. See Concentratinn.

DEPILOGISTICA'ED, in chemifry, any thing deprised of the phlogiton fuppofed to be contained in it.

Deablogisticitab Air, an invifible clatic fuid, of fomewhat greater feecitio gravity than that of the common atmofphere, and catodble of fupporting animal life and flame for a much longer time than the air we commonly breathe.

This lluid was ferf difcovered by Dr Prietly and a very fort time afier by Mr Schecle, who appears to have been entirely unacquainted with what the boctor had done. The methods of making it artificially are enumerated under the article Aerology; here we fhall make fome ohfervations on the wa: in which nature feems to aceomplith the fame end. Under that article, as well as that of Fixed Air, and others cosinocted with them, it has been obferved, that his kind of air beeones convertible into fixed air by the additom of a certain pmportion of pllogriton or chareoal ; and that thefe two ingredients may be again leparated by certain means; the dephlogifticated air affuming its proner llate, and the charcoal its own native form $A$ great number of experiments alfo are there related concerning the effects of vegetables in purifying tainted air, and their emilfon of the dephlogitticated kind; which has been thought $t$ indicate, that vegeration is probably one of the methods by which nature fupplits the grat quantity of this fluid necufary for the purpoles of animal life. This was fuggefled by an expesiment of Dr Pieftey, who lad difcovered that pumpwater, on being expofed to the light of the fun, foon began to emit pure air; and that, after fome days, a quantity of green matter accumalated on the fides of the veffel. This was naturally fuppofed to be of the vegetable kind, till Sir Benjamin Thomfon found it to condfl of a number of very minate animals. ETpon this difcovery he difputed the commonly received opinion, that vegetation is employed by nature as a purifier of the atmofpherical air. He likewife gpofed the conclafon drawn from Dr Ingenhoure's expesiments, who had obferved that frefh leaves of plant: inmorfed in water, and expofed to the light, emitted a valt quantioy of dephlogiticated air. Sir benjumin jully ubferved, that a leaf certainly cealed to vegetate after being feparated from the plant on which it grew: and shersfore the emiftion of ahis kied o: ain could by no means b: aforibed to
veretation: as a mone decifie proof of which, he Derhorie likewife utged, that les:es, after beingentisely chad and dicated is. whithered, would notwithtanding emit chphtagiticotud air for a very conhdeable time. "Thus maters lewned to be rencerd dorbthel; but by ath attentive ohervation of all ciremathace, relatiog to thefe ex. periments, we thall him that condiderable light will be thown upon the fubject.

In the dirit piace, we are to confider that the light of the fun, or at leart a very froms lisht of fome kiad, is neceffary in all thefe productions of dephorsifteated air ; for if the apparatus is fet in a very dark plate, liatle will be furmed, and that of a lant quality. So benorant are we of the nature of this mythentons flud, that fearee any inguiry has becn made into its mode of operation in producing depllogiticated air. By fome the clement of light has been luppoled to be phlogitton it felf, or fome modifacation of it: but fince the diforvery of the identiiy of phatoriton and charcoal, it is probable that this on inion will not be held by many: Oace fermont, however, commonly brought in favener of this happotition, defences particular attention. This is the propesty which light has of giving a black colent to the calces of fiver; a phenomenon fo remarkable, that it has becn inagined an intubitable proof of the identity of light and phogiton. In like manner, the pure and dephoniticated fpirio of nitere is fond to be eonverted into the phlogiticated and finoking kind by expolire to the folar rass. 'flue extentive diffurn of the fublance called phomifon, however, is now for wll known, that we may reafonably conclude, that in thefe experiments it was contaned in the in. gredients themidves, and not in the light. Thus when hiver is precipinated by chalk, and the mafs turns black on (xpolime to the fun's rays, we are very fure that the chalk centaime phogillon; and that there is a athertion betnet: the nectalhe alan and this principla: but ite are by no means afcertained of the nature of 1i, ha, as mot being in amy manner of way the lubject ui ous imeftigation excent by ubfrwing its cfects. As in all othereafes, therefore, whac light is conectred, we can only lay that fuch a thing is the offoce of the operation of light, and not the fabltates of the clenazar made vidible, or converted into fome other thing; we have tab rafon, in this cafe, to fay, that the blackening of the metallic cals is any other than an cifect of the lighe's operation, and mot the detention of any part of its fatatance. 'This operation may be eatly conceived to be the promoting of the union of the phlugithon and cals, which we know that light has a great tendency to do at any rate when we angment its action in fuch : manner as to make it become fire. The tendency of light, :lerefore, to promote an union betwist phlugitlon and other fubltances, will explais this and many other experiments in a very caly manreer. In the cafe of chalk and calx of filver, the action of the light emables the eals to attract the phlugitton of the chalk, and thus becume black. If the calx is not precipitated by chalk, but by an alisal, it mott be in contact either with ais, water, or fome uther tluid. All thefe undoubtedly contain phalogitom. With regard to air, it has not been denied what it is a general receptan in of ah the decayed and volatile pates of vegcalakes and mimals; that it contains vate quantities of imfamable ats, which ate coatanty cmitued

## D E P

Dephtoni- From various parts of the earth; mad, according to the nicute fir. Phlogiltians, that fuid called phomifitated air, which - contitutes the other part of the fluid we breathe, likewife contains a quantity of the fame matter. We are not to be furpifed therefore that, in the cafe of the cals: of filver, fome of thefe fubitances thould be obliged to part with a little of their phlogitton, fufficient to blacken the metallic earth. In order to prove that light and phlogifton are the fame, the experiment ought to fucceed in a persect vacuum, of which there is no probability; though indeed it has never been tried that we know of. In like manner, when fpirit of nitre is rendeted high coloured and fimoking by expofure to the fun in a glafs, the phloritton may come either from the glafs itfelf, which is now found to contain phlogiton, or from the quantity of air which is necefiary to be left in the glafs, in order to make the experiment fucceed.

Thus we may reafonably fuppofe the blackening of the cals of filver, and the rendering clear fpirit of nitre high-coloured, to proceed only from the feparation of phlogiton by means of light, and its confequent attraction by the calx or acid; and in other cafes, where any fimilar effect is obferved by the expolure of bodies to that element, we are to fuppofe that it is occalioned by the detachment of phlugiton from one fubtance and its attachment to another. In the cafic of the emiffion of dephlogiticated air by means of light, therefore, we may, by reafoning analogically, conclude, that it is occationed by the abforption of phlogiton by the fubtance which is faid to cmit the air.

Defore this matter, however, can be determined exactiy, we ought to be well acquainted with the comfofition of dephlogitticated air itfelf; and iudeed, without this, it fetms almoft ia vain to fpeak upon the fubjuct. Bu:, notwith" ouding the labours and ingenuity of modern aerologits, this point has not been in any degree fettled. On examination, it is found to confit of an invifible fluid which does not appear to gravitate, and which in all probability is no other than elementary fire; and of another fubftance equally invifible, but capable of attaching itfelf to certain bodies, particulaly iron, and adding to its weight vely confiderably. On attempting to procure this fubAtance by itfelf, we find the attachment fo frong, that no force of fire can feparate them. In attempting a decompofition by means of the tlectric fpark, all that has been yet done, even with the greateft power of clectricity excited by Van Marum's new machine, is to make it lofe fome part of its bulk, the remainder appeating by the eudiometer to have undergone no change. Dr Prieftley, in his fixth volume of Experiments on Air, acquiefces in the opinion fuggetled to him by Mr Watt, that the air in queftion is nothing elfe but one of the component paits of water mited with the element of heat. Allowing this to be jutt, and indeed there is no experiment hithero publifhed by which it can be contradiated, the natural method of the production of dephlogiticated air from water may be eafily explained. This only requires us to fuppofe, that the fubtances imnerfed in the water, are by the action of the fun's light made to attract part of the phiogiton of the water; in confequencerof which the dephlogiticated part of that clement, inftantly being
volatilized by the light and heat of the fun (for heat Defhlogi. is neceffary for the production as weill as light), affumes ficatedAir. the properties of dephlogitticated air. But why, it may be afked, dues water of itfelf emit dephlogiticated air without any fubllance whatever immerfed in it? or, after certain fubftances have been immerfed in it, by which this emiflion is promoted, why does the production of air ltop with regard to any particular fubitance, and any determined quantity of water? Thus, it may be faid, if any quantity of water, fuppofe a pint, yieds one inch of cubic air by the immerlion of a certain fubtitance into it, why doea not this fubitance attract from it all the phlogifton it is capable of abforbing? Inftead of this, the water appears, by the colour it acquires, to be more phiogiticated than before; and the fubtance :mmerfed, by being put into frefh water, will immediately occafion the emiffion of new quantities of air, and this for feveral times runing. But to this it may be replied, that though the fubHance immerled attracts the phiogition of the water, the latter will pat with it only to a cestain degree; and it is well known, that when two fubllances arc united to the point of faturation by chemical attraction, the abltracion of a part of one of them will increafe the attraction betwixt the remainder to a great degree. Though the fibbtance immerfed in the fluid, therefore, has origimally a greater attraction for the phlogifton of the water than the dephlogifticated part of the element itfli; yet as the one gradually augments, and the other diminthes, a balance foon takes place. With regad to the green colour generally alfumed by the water after. fuch experiments, is moft probably proceeds from an accumulation of fome ierteftrial particles partly fupplied by the immerfed fubtance, or perhaps from a difpofition to generate the green matter deferved by Dr Pricitley. That the fubltance immered in the water does reaily part with fome particles, is cvident, becaule the water freell, of it, as when raw filk is made ufe of; nor can we fuppofe that any vegetable or anmal fubitance, fuch as are found to be alone fit for thefe experiments, can endure a long maceration in water without parting with a conliderable quantity of their component parts. Indeed, under the article Charcoal, it is fhown that this body, though now allowed to be pure phlogiton, or the next thing to it , has the power of feparating other phogitic matter, probably fuch as is more impure, from different fubtances. Hence its property of whitening tartar, purifying malt fpirits, \&ic. It is not unreafonable, therefore, to fuppofe, that a dead leaf, though a very phlogittic fabttance, may have the power of attracting more phiogilion fion the water, and thus allowing part of that element to be changed into dephlogiticated air ; while, in lien of the phlogiton attracted from the water, it diffures a certain portion of its own fubflance through the fluid, and thus gives it the colour in queftion. With regard to the other difficulty, viz. that water, when expofed to the folar rays, will emit dephlogiflicaied air without any thing immerfed in it, it nay be accounted for from the eafe with which the dephlogificated part of the water is volatilized; fo that the attraction of the other is not able to detain it. This we find exemplified in feveral chemical experiments, as when a volatile alkali is joined with any of the more fixed acids; for in thefe cafes the alkali,

## D E P [ 567 D $\quad\left[\begin{array}{lll}6 & \text { D P }\end{array}\right.$

Dephlori- notwithftanding the mutual attaction betwixt it and Atiatedair the acid, will be made to Ay off by a ltrong heat.

On the fuppofition that dephlogiticated air in com. poled of elenentary fire and one of the conllitnent parta of water, there is very little dimatity in accounting for the origio of the immente quatity neceflary to fopply the animel creation with it. Under the article DAMPs, it has been fown that a vall quantity of fixed air is contimutly tabmated in the bowels of the earth. This is compofed entirely of dephlogitheated air, compounded with a certain portion of phlogiten. Part of this tixed air mult be ondoubtedly evaporating contantly from the furfice, and woull as certainty infect the lower parts of the atmofphere, were there not fome natural caufes for its decompofition. One of the fe indoureedly is the abforption of the phlogithic part by vegetables, which underthe arcide Agriculture is hown to be their proper food. lout when the phlogiton is abborbed, a great quantity of dephlogillicated air is frepared, which fupplies the deliciency occafioned by the refpiration of animals. It mult likewife be olverved, that after che dephlogifticated air has been fooiled either by refpiration or the fupport of flame, it is not for that teafon entirely denroyed, but only converied into fixed air, and confequencly may again be puifited as before.

It may be likewife realonably fuppofed, that in cafes where vegetation does not take place, and in fpring before the plants begin to exert their vegctative powers, and in autumn, or the beginning of winter, when they decay, the vergetable foil itfiff may perform this offee: and indeed the circumbance of freth vegetable mold affording an agreeable fmell when turned up, as is mentioned ander the article Agrictlture, feems to be a confiderable confirmation of this.

The property which water tas of ablorbing fixed air, and allo phlorifon, may likewife induce us to fuppole that it acts as a porifier not only of the common atmofphere, but of that which iffiss from the earth; and hence fome waters, paticulaly that of the ceran, are found to contain air if a purer kind than that of the atmofphere.

As light, however, is an indifperlable requinte in all thefe caks, a difficulty fill remairs concerning the production of dephlogiticated air in winter, when the licht and heat are fo much diminithed. In this feafon, irdeed, it is probabie that a quantity will be produced greatly inferior to that which the fummer affurds: but here we may very reafonably have recourfe to the immoule magazine of the atmofphere itiflif; which, from the mere circumfance of quantity, mit be mach more than fufficient to anfwer the experces of one leafon; eipecialty when tie confider, that in fummer a funeratumdant quantity is certainly produced. Add to this, that in extreme cold, fixed air feems not only to be lefa noxicas than at other times. but even neceflaty for the pre-

- Sce Fix. fervation of health *. We mult likewife confider, that
air, he found that the red cobour of the blood denends Dephlagion the air; that by coming in contait with ne, the aticated air black venoes hood became in a very thort time of a Deperation beautifut Arid colour; and that even the under fide of a clut of blood, by exprofare to the air, will lufe its difarremble dark colour, an! affume the fame with that of blood newly drawn. Thele effects are cotirely to be attributed to the deplitogiticated part: and his theory of refpiration beinis a pllugitic procefs, feems to be fully confirmed by the difcovery of the compoftion of fised air. For, as fixed air is known (i) be compofed of phogiton and dephlogiticated air, wecan" nue lappole thes phtogiaon io be derived from any or ther bonace shan the hings. "The doetur in this theory likewife obviates an chjection that might naturally occur, that the air has not inmediate accefs to the blook in the luners, becaufe of the thin membranes of the velo fels which intervenc. But, from his experiments, it appeans that this is no obllacle. The ferum of blood he tinds to be capable of tranhitting dephtugitlicate air, or at leaft of propagatiog this eftect through a vety contiderable thicknels of its own fubfance, as well as through bladters moittened with it; a property which does not beluge to any other animal fluid.
$A$, chets giticated air is now known to be the im medidte fuppurt of animal life, it has naturally been fuppoled that it might anfwer valuable parpotes in medicine; but the difficulty of procuring it in fufficient quantity has hitherto preve aid the le bopes from being reatized, excepting only in cafes of drounitg. where it is laid to prodnce very great effecis. With regatd to any methot of preparing it, no farther difcovery has been made than what is luggeted under the article Aerology.

DEPILATORY MEDICINES, thofe applied in order to take off the hair: fuch are lime and orpinent known to be, but which ought to be ufed with great caution.

DEPONENT, in Latin grammar, a term apphed to verbs which have active fignitications, but paffive tenminations or conjugations, and want one of their participles paffie.

Deponent, in the law of Scotland, a perfon who makes a depotition. See Deposition.

DEPOPLLATION, the act of diminiming the number of pecple in any country, whether by war or bad politics.

DEPORTATION, a fort of banithmert ufed by the Romans, wherchy fome mand or other place was allotied to a criminal for the piace of his abode, with a prohibition not to ftir out of the fame on pain of death.

DEPOSIT, among civilians, fometring that is committed to the cullody of a perfon, to be kept without any reward, and to be returned again on demand.

DEFOSITARY, in law, a perfon intrulted as keeper or graardian of a depoft.

DEPOSITION, in law, the teftimony given ia court by a witnefs upon oath.

Deprosition is alfo ufed for the fecueftering or depriving a perfon of his dignity and office.

This depofition only differs from abdication, in that the latter is fuppofed voluntary, and the act of the dignitary, or officer limfelf; and the former of compulfion, being the adt of a fuperior gower, whofe autho-

Depreca-
tula ii

bity extends thercto. Some fay the depolition, and fone the alodication, of king James 1 f .

Depofition does not differ from deprivation: we fay indilferently, a depofed, or depriced bihop, oficial, S.c.

Depolition difiers from fuipetion, int that it ablolutely and for ever Mrips or divetts a prich, \&又e. of all dignity, oflice, \&c. whercas fufpenfion only prolutits, or tellrains, the exercife thereof.

Depolition only differs from degradation, in that the latter is more formal, and attended with more ciscumllances, than the former; but in effect and fubsance they are the fame; thofe additional circunflances being only matter of thow, harl fet on foot ont of zeal and indignation, and kept up by cuftom, but not warranted by the laws or camons. See DegraDation.
1)EPRECATION, in rhetoric, a figure whereby the orator invokes the aid and affilance of fome one; or prays for fome great wil or punthment to befal him who fpeaks fallely, either himilf or his adverfary.

DEPRECATORS, memRecativf, intheologr, a term applied to the namer of yerforming fome ctremonies in the form of prayer.

The form of abfolution is deprecative in the Greek church, being conceived in thefe terms, May God abfolve you: whercas it is in the declarative form in the Latin chureh, and in fome of the reformed churches, I alfolve you.
1)EPRESSION of the Pole. When a perfon fails or travels towards the equator, lee is faid to deprefs the pole ; becaufe as many degrees as he approaches nearer the equator, fo many degrees will the pole be nearer the horizon. This phenomenon arifes from the fpherical figure of the eartl.

DEPRESSOR, or Depramens, in anatomy, a nane applicd to feveral mufcles, becaufe they deprefs the parts they are fallened to.

DEPRIVATION, in the common, law, the act of bereaving, divenling, or taking away a fpiritual promotion or dignity: as when a bifhcp, vicar, piebend, or the like, is depofed or deptived of his preferment, for fome matter, or fault, in fact, or in law. See Deposition.

Derrivation is of two kinds; a boncitio, et ab offic.

Deprivation a bimgicio is, when for fome great crime a minitter is wholly and for every deprivad of his living or freferment: which difiers from fopenfon, in that the latter is only temporary.

Depremaron al atforio, is when ammiter is for ever deprived of his oriter: which is the fame, in realitr, with what we otherwife call doplition and dergatantion; and is ufually for fome hoinous orime doterving death, and is performed by the bihop in a folem manner. Sec Drgrabation.

DEPTIORD, a tuwn three miles cait of London, on the forthen bunks of the Thames; chiefty comiduatle for its fine ducks for huiking hios, and the hing's yad. L. Long. O. 4. N. Lat. 5 I. 30 .

1) PP'TH, the wrafte of any thing foom the furface a, wnwads.

Meguring of Donatis ly the Butamer, depends on The fame piotephes on which kefote at: nowturad by Nor 800.

## D E P

the fame intraminh. The menfaration of deptes being Defuration chicfly applied to mines, is thll more precarious than the menfuration of heights, on account of the various kinds of vapours with which thefe fubteranam regions are filled. But for a paticular account of thate difo ficulties, with the beft methods of obviating then, bed the articles Darometer and Mines.

DJtPTH of a Spundron, or Luatalion, is the number of men in a fite; which in a fquadron is three, and in a battalion generally fix. See Souadron, File, 㣽.

We fay, the battalion was drawn up lix deep; the enemics horfe were drawe up five daso.

DEI'CRATION is the frecing of any fluid from its heterogencous matter or feculence. It is of theer kinds. I. Deeantation; which is performed by letting the liquid to be depurated fland for fome time in a pretty deep vefiel, till the grofs fediment has fallen to the boitom ; after whicli the elear fluid is poured off. 2. Defpumation; which is performed by means of the whites of eqgs, or other ricid mater, and is alfo cailed clarification. 3. Filtration. See Chemistry. $n^{\circ} 6 y$.

DEPUR, 1 TORY FEver, a name given by Sydenham to a fever which prevaled much in the yearsi $G \in$, 1662 , 1663 , and 1654 . He called it depuratory, becaufe he fuppofed that nature regulated all the fymptoms in fuch a manner, as to fit the feurile matter, prepared by proper concoction, for expulion in a certain time, either by a copions fweat or a freer perfiration.
D) EPETATION, a mimion of fekect perfons out of a company or body, to a prince or affembly, to treat of matters in their name.
1)EPUTS, a perfon fent upon fome tufincls by fome community.

Deputy is alo one that excreifes an office in ano. ther's right; and the forfeiture or mifdemeanour of fuch deputy thall caufe the perion whom he aeprefens to lole his uffice.

DEPUTATUS, among the ancients, a name apo plied to perfons employed in making of armour ; and hikewife to bilk asture peoph, wiove bufinefs was to take cart of the wounded in engagoments, and cary them of the ficld.

DER, a fyldable frequently prefixed io the names of places in Englund. It is taid to fignify that fiechwere fomenly places wheme wild hatis herded togetie:, fo ealled from the Saxon deat fion, undels the lituation was hear fume diver.

DRRDEND, a floag town of Alia, in Perfia, faid to have been founded by Alexander the Gicut. The walls are built with tlunes ats fand as marble; and was it are the remions of a wall willoh reached from the Cdfrian to blu Elack Sea. It io leated near the Calpian Sca, at the fient of Mome Cancalus. E. Longo 50.0.N. Lat. .2. 8.

DEKB!, the capital of a county of the fame name in England. It is thought to have received its name from beine formerly a parts or theler for deer; and what takes this fupposition more pobable is, that the arms of tie cown comist of a buck conchant in a park. It is sem ancoms, huving becs a royal borough in the dime or Eidnard the Comfofor. Abplefor it is a neat to ma, ves: raphonas, and itnds wa nembers to parliameut. "h diginion formations of houfes, har
man

Derby hire man bones of a monftrous fize have fometimes been found. The trade conlifts in wool, corn, malt, and ale, of which confiderable quantities are fent to London. Here alfo is that curious machine for throwing filk, the model of which Sir Thomas Lombe, at the hazard of his life, brought from Italy. Before that time, the Englifa merchants ufed to purchafe thrown filks of the Italians for ready money. But by the help of this wonderful machine, one hand-mill will twift as much filk as 50 people could do without it. It works 73,726 yards of filk every time the water-wheel goes round, which is thrice in a minute. The houfe in which it is contained is five or fix fories high, and half a quarter of a mile in length. When Sir Thomas's patent expired in $173^{2}$, the parliament were fo fenfible of the value and importance of the machine, that they granted him a further recompence of 14,0001 . for the hazard and expence he had incurred in introducing and erecting it, upon condition he fhould allow an exact model of it to be taken. This model is depofited in the Tower of London, in order to prevent fo curious and important an art from being loft. The town of Derby is watered by a river and a brook; the latter of which has nine bridges over it, the former only one. Derby gives title of Earl to the noble family of Stanley, being the fecond earldom in England. W. Long. I. 45 . N. Lat. 52 . 57.

DERBY-shire, a county of England, bounded on the eaft by Nottingham-fhire, and a part of Leicefterfiere, which laft bounds it alfo on the fouth. On the weft it is bounded by Stafford-hire, and part of CheChire; and on the north by Yorkfhire. It is near 40 miles in length from fouth to north; about 30 in breadth on the north fide, but on the fouth no more than fix.-The air is pleafant and healthful, efpecially on the call fide ; but on the welt, aboui the peak, it is fharper and more fubject to wind and rain. The foil is very different in different parts of the country. In the ealt and fouth parts it is very fruitful in all kinds of grain; but in the weft, beyond the Derwent, it is barren and mountainous, producing nothing but a little oats. There is, however, plenty of grafs in the valleys, which affords pafture to a great number of theep. This part of the conntry is called the $P_{e a k}$, from a Saxon word fignifying an eminence. Its mountains are very bleak, high, and barren; but extremely profitable to the inhabitants. They yield great quantities of the beft lead, antimony, iron, fcythe-ftones, grind-ftones, marble, alabafter, a coarfe fort of cryftal, azure, fpar, and pit-coal. In the fe mountains are two remarkable caverns, named Pool's Hole, and Ellicn-Hole; for a defcription of which, fee thefe articles.
DEREHAM, a town of Norfolk in England, fitu. ated in E. Long. I. o. N. Lat. 52.40. It is pretty large, and the market is noted for woollen yarn.

DERELICTS, (from $d e$, and relinquo, "I leave"), in the civil law, are fuch gocds as are wilfully thrown away, or relinquifled by the owner.
Deretict is alfo applied to fuch lands as the fea receding from leaves dry, and fit for cultivation. If they are left by a gradual recefs of the fea, they are adjudged to belong to the owner of the adjoining lands; but when au ifland is formed in the fea, or a

Vul. V. Part II.

Jarge quantity of new land appears, fuch dereliç lands belong to the king.

DERHAM (Doctor William), a very celebrated Dermence Englifh philofopher and divine, born in 1657 . In 1682, he was prefented to the vicarage of Wargrave in Berkfhire; and, in 1689, to the valuable rectory of Upminfter in Effex ; which latter lying at a convenient diftance from London, affurded him an opportunity of converfing and correfponding with the greateft virtuofos of the nation. Applying bimielf there with great eagernefs to natural and experimental philofophy, he foon became a diftinguifhed member of the Royal Society, whofe Philofophical Tranfactions contain a great variety of curious and valuable pieces, the fruits of his laudable induftry. In his younger yeare he publifhed his Artificial Clockmaker, which las bee" often printed: and in 1711, 1712, and 1714, he preached thofe fermons at Boylc's lecture which he afterward digetted under the well-known titles of $P$ by-fico-Theology and Afro-Tboology, and enriched with valuable notes and copper-plates. The laft thing he publifted of his own compolition was Cbrifo-Theolog', a demonflration of the divine auchority of the Chrillian religion, being the fubtance of a fermon preached at Bath in 1729. This great good man, after fpending his life in the mot agreeable as well as improving itsdy of nature, died at Upminter in 1735; and, befide many other works, left a valuable collection of curiofities, particularly fpecimens of birds and infects of this ifland.-It may be neceffary juft to obferve, that $\operatorname{Dr}$ Derham was very well flilled in medical as well as in phyfical knowledge; and was conttantly a phyfician to the bodies as well as the fouls of his parifhioners.

DERIVATION, in medicine, is when a humour which cannot conveniently be evacuated at the part affected, is attracted from thence, and difcharged elfewhere; thus, a blifter is applied to the neek to draw away the humour from the eyes.

Derivation, in grammar, the affinity one word has with another, by having been originally formed from it. See Derivative.

DERIVATIVE, in grammar, a word which takez its origin from another word, called its primitive. Such is the word derivative itfelf, which takes its origin from the primitive rivus, a rivulet or channel, out of which leffer ftreams are drawn; and thus manbood, deity, luwyer, \&c. are derived from man, deus, larv, \&c.

DERMESTES, in zoology, a genus of infeets belonging to the order of colenptera. The antenna are clavated, with three of the joints thicker than the reft; the breaft is convex; and the hcad is infected bclow the breall. The fpecies are pretty numerons.

1. The lardarius is of an oblong furm and of a dine hlack colour, eatily diftinguifhable by a light brown ftripe that occupies tranfverfely almoft the anterior half of the elytra. That colour depends on fmall grey hairs fituated on that part. The ftripe is irregular at ita edges, and interfeced through the middle by a finall tranfverfal ftreak of black fpots, three in number on each of the elytra, the middlemolt of which is fomewhat lower than the ret, which gives the black freek a lerpentine form. Its larva that is oblung, fomewhat 5 E hairy,

## D E R [770 ] D E R

Syrnefes hairy, and cuvided into fegrent, alternately dark and the infects; it in collections, and even feeds upon
, in allio to be found in old bicon. 2. The .nencus varies greatly in lize and colour, fone being found of a dark brown, others of a much lighter clyera are flizatend, the thon, almof cylimorical. 'The bons. This little animal, when thick and rather gibhead under its thorax and its touched, dath's in its men, remaining fo motionlefs that one would think it dead. Thins is the fame infect which makea in wooden furniture thone litule round lules that reduce it to powder. 3. The violaceus is a beantiful litte infect: its elytra are of a deep willet blue. The thorax is covered with greenilh hairs, the legs are black. The whole aninal being of a glitering billiancy renders it a plea. fing object. The la:va, as well as the perfoct infect, inhatits the bodies of dead aninals. a. The fumatus is of a light brown, except the eyes, which are hlack. It is however fometimes more or lefs deep. The thorax is margined, and the infect has the whole carriage of a fearabeus; but its antenne have the claracter of thofe of the dermelix. This little creature is found in dung. It alfo frequently finds its way into houfes. 5. The ferrusineus is the largelt of the genus; its cotour is a rully iron, having many oblone, velvety, hack foots upon the elytra, which gives the inlect a frlormy, yet elegant appearance. The antenne difer forn the preceding fecies; the three laft articulations being confurably longer, thicker, and not perfoliaとec̀.

There are 25 other fpecies, dillingeifhed by their culuur.--Many varietics of this genus, as well as the larve, are to be met with in dried fkins, bark of trees, wond, feeds, flowers, the carcales of dead animals, \&c. -The lardarius, fo dentructive to birds, infects, and nther futjeets of natural hiftory preferved in cabinets, is to be killad by arfenic.

DERNIER bessort. See Ressort.
DEROGATION, an act contrary to a preceding one, and which annuls, deftroys, and revokes it, either in whole or in part.
1)EROGATORY, a claufe importing derogation. A derogatory claufe in a teftament, is a certain fentence, cipher, or fecret character, which the teftator inferts in his will, and of which he referves the knowledge to himfelf alone, adding a condition, that no will he may make hereafter is to be reckoned valid, if this derogatory clatife is not inferted exprefsly and word for wurd. It is a precaution invented by lawyers againt later-wilh cxtorted by violence, or obtained by fuggeftion.

LERP, a town of Livonia, and capital of a palatinate of the fane name, with a bilhop's fee, and an univerfity. It is fubject to the Ruffians, and lies near the nver Ambeek. E. Long. 31.55 . N. Lat. 30.40.

DERTONA, Derton, or Derthon (anc. geog.), a rolony of the Cifpadaria; called Fulia Augufin, on inferiptions and coins; midway between Genoa and Placentin, and fituated to the eaft of the 'Tanarus in Li guria. Now Tortona, a city of Milan. E. Long. 9. 12. N. Lat. 45.

DERTOSA, (anc. qeog.); the capital of the llercaones, in Tarraconenfis, or the Hither Spain: a mu-
nicipum and colony; furnamed Fuliat Ilergavomia (Coin.) Derventio, Dertofani, the people. Now Tortofa, in Catalonia, Dervis. on the Ebro. E. Long. 15. N. Lat. 40.45.

DERVENTIO, (anc. geog.) ; a river of the Brigantes in Britain. Now the Darwent, in the eaft of Yonkihire, falling into the Oufe. Alfo a town of the Brigantes on the fame river. Now called Aulddy, fe. ven miles from York, to the north-eall (Cunden).

DERVIS, or Dervich, a name given to a fort of monks among the Turks, who lcad a very autere life, and profefs extreme poverty : thongh they are allowed to marry. The word is originally Perfina, wher. fignifying a "beggar," of perfon who tias nothing: and becaute the religimas, and particularly the followers of Mevelava, piofets not to polfefs any thine, they call Fwh the religious in general, and the Mevelavites in particular, Dirvifes or Dervichos.

The dervifes, called alio Alevelavites, are a Maho. metan order of religions; the chief or founder whereof was one Mevelava. They are now very numerons. Theis chief monattery is that near Cogna in Natolia. where the general makes his refidence, and where all the aflemblics of the order are held; the other houfes being all dependent on this, by a privilege granted to this monaftery under O:toman I.

The dervifes affeet a great deâl of modefty, patience, humility, and charity. They always go barelegged and open-breafted, and frequently burn themfelves with hot irons, to inare in mblelves to patience. They always faft on Wedneflays, eating nothing on thore days till after fun-fet. Tuefdays and Fidays they hold meetings, at which the fuperior of the houfe prefides. One of them playe all the while on a flute, and the reft dance, tuning their bodies rourd and round with the greatef fwifnefs imaginable. Long cultom to this exercife from their youth has brought them to fuch a habitude, that it does not difeorapofe them at all. This practice they obierve with great frict nefs, in memory of Mevelava their patriarch's turning miraculoufly round, as they pretend, for the fpace of four days, without any food or refrefhment ; his companion Hamla playing all the while on the flute: after which he fell into an ecttafy, and therein received wonderfus revelations for the etablifhment of his order. They believe the flute an inftrument confecrated by Jacob and the fhepherds of the Old Teftament, becanfe they fang the praifes of God upon them. They profefs poverty, chaftity, and obedience, and really obierve them while they remain dervifes; but if they choofe to go out and marry, they are always allowed.

The generality of dervifes are mountebanks: fome apply themfelves to legerdemain, poftures, \&c. to amufe the people; others give in to forecry and magic: but all of them, contrary to Mahomet's precept, are faid to drink wine, brandy, and other trong liquors, to give them the degree of gaiety their order requires.

Befide their great faint Mevelava, there are particular faints honoured in fome particular monafteries: as Kiderele, greatly revered in the monafleries of Egypt, and held by fome to be St George: and by others, with more probability, the prophet Elias.
The dervifes are great travellers; and, onder pretence of preaching, and propagating their faith, are continually palfing from one place to another: on which account they have been frequently ufed as fies.

There

## D E S [ 77I ] D E S

Defaguliers There are alfo dervifes in Perfia, called in that counDefcant. try Aldals, q. d. fervon's of Goul. They lead a very penurious, antere life, and preach the Alcoran in the
flrects, coffee-houfes, and wherever they can meet with auditors. The Perlian dervifes retail little but fables to the people, and are in the uimolt contempt among the inen of fenfe and letters.

There are in Esypt two or three kinds: thofe that are in convents, are in a manner of the religious order, and live retired; though there are of thefe fome who travel and return again to their convents. Some take this character, and yet live with their familier, and exercife their trades : of this kind are the dancing derviles at Damafcus, who go once or twice a week to a little uninhatited convent, and perform their extraordinaty exercifes; thefe alfo feem to be a good people: but there is a third fort of them who travel about the country, and beg, or raiher oblige people to give, for whenever they found their horn fomething muit be given them. The people of thefe orders, in Egypt, wear an oclagonal badge, of a greenith white alabafter, at their girdes, and a liggh itiff cap without any thing ronnd $i t$.

DEs.AGULIERS (Juhn Theophilus), who introduced the pratice of reading public lectures in experimental philufophy in the metropolis, and who made feveral improvements in mechanics; was the fon oi the reverend I ihn Defaguliers, a Fiench proteftant refugee, and was born at Rechelle in 1683. His father brought him to England an infant; and at a proper age phaced him at Chrift-church college. Oxford: where he fucceeled Dr Keil in reading lectures on experimental philofophy at Hart Hall. The magnificent duke of Chandos made 1)r Defaguliers his chaplain, and prefented him to the living of Edgware, near his ieat at Cannons : and he was afterward chaplain to Frederic prince of Wales. He read lecturea with great fuccels to the time of his death in 1749 . He communicated many curious papers printed in the Philofophical Tranfactions ; publifhed a valuable ciourfe of Experimatal Philofopho, in 2 vols 4 to.; and gave an edition of Gregory's Eitimests of Cutopstics and Dioplricts, with an Appendix on reflectiug telefoopes, 8vo. He was a member of the Royal S sciety, and of feveral foreirn academies.

DESART, a large extent of country entitely barren, and producing nothing. In this fenfe fome are fandy defarts; as thofe of Lop, Xamo, Arabia, and Several others in Alia; in Africa, thofe of Libya and 'Zara: others are ftony, as the defart of Pharan in A. rabia Petrea.

The DFs.iRT, abfohtely fo called, is that part of Arabia, fouth of the Holy Land, where the children of Ifrael wandered forty years.

DESCANT, in mufic, the art of compofing in feveral parts. Sce Composition.

Defcant is three-fold, viz. plain, figurative, and duuble.

Plein DESCANT is the ground-work and foundation of all mufical cumputitions, confifting altogether in the ordelly placing of many concords, anfwering to timple counterpoint. See Counterpoint.

Figuration or Florid Descanf, is that part of an air of mufic whercin fome difcords are concerned, as well, though not fo much, as concords. This may be term.
ed the ornamental and rhetorical part of mafie, in re. gard that these ane introduced all the suraction of points, fyncoper, divertities of meafores, and whatever is capable of adorning the coupotition.

Dsseane 1)able, is when the pats are fo contived, that the treble, or any hing part, may be inade the bafa; and, on the contrary, the bafs the treble.

DESCARLES. Sue Cartes.
DESCENLANT. The iflue of a common parent, in infinitum, are called his defeemdants. See the articie Descent.

IISSCENSION, in aftronony, is cither right or oblique.

Sight Drsernston, is an arch of the equinodial, intercepted between the next equinoctial point and the interfection of the meridian, pailing through the centre of the object, at its fetting, in a right fphere.

Obligue Discension, an arch of the cquinoctial, inter. cepted between the mext equinochial point and the horizon, palling through the centre of the objedt, at its fetting, in an oblique fphere.

DESCENT, in general, is the tendency of a body from a higher to a lower place; thus all bodies, undefs otherwite determined by a force fuperior to their gra. vity, defcend towards the centre of the earth. See Gravity and Mechanics.

Descent, or Hereditary Succefor, in law, is tile title whercby a man, on the death of his ancedtor, acquires his eftate by right of reprefentation, as his heir dt law. An heir, therefore, is he upon whom the law calts the eflate immediately on the death of the anceltor; and an eftate fo defeending to the heir is in law calied the inboritume.

Defcent is either lineal or colloteral. The fomer is that conveyed down in a right line frosn the grandfather to the father, and from the father to the fon, and from the fon to the grandion. 'I'he latter is that Springing out of the fide of the line or blood; as from a man to his brother, nephew, or the like.

The doctrine of defeents, or law of inkeritances in fee-fimple, is a point of the highent importance: (See the article leer). Al! the rules relating to purchafes, whereby the legal coufe of defeents is broken and alteted, perpetually refer to this fottled law of inheritance, as a datum or fortt principle miverfally known, and upon which their fubfequent limitations are to work. Thus a gift in tail, or to a man and the heirs of his body, is a limitation that camnot be perfectly underfood without a previous knowledge of the law of defeents in fecfimple. One may well perceive, that this is an eflate confued in its defeent to fuch heirs only of the donee as have fprang or thall fpring from his body : but who thole heirs are, whether all his children both male and female, or the male only, and (among the males) whether the elden, youngett, or uther fon alone, or all the fons together, flatl be his lair ; this is a point that we muft refult back to the itanding law of defeents in feefimple to be informed of.

And as this depends not a little on the nature of kindred, and the feveral degrees of confanguinity, it will be neceffary to refer the reader to the article Consanguinity, whare the true notion of this kindred or alliance in blood is patticularly Itated.

We thall here exhibit a feries of rules or canous of inheritance, with illulhrations, according to which, by

Shrombt

## D E S $\quad\left[\begin{array}{lll}772\end{array}\right] \quad$ D E S

Defcent. the law of England, eftates are tranfmitted from the anceftor to the heir.

1. "Inheritances fhall lineally defcend to the iffue of the perfon laft actually feifed in infinitum, but thall never lineally afcend."

To undertand both this and the fubfequent rules, it muit be obferred, that by law no inheritance can veft, nor can any perfon be the actual complete heir of another, till the anceftor is previoully dead. Nemo of barres viventis. Before that time, the perfon who is next in the line of fucceffion is called an leir apparent or beir trefumptive. Heirs apparent are fuch whofe right of inheritance is indefeafible, provided they outlive the anceftor; as the eldeft fon or his iffue, who mutt, by the courfe of the common law, be heirs to the father whenever he happens to die. Heirs prefumptive are fuch, who, if the anceftor hould die immediately. would in the prefent circumftances of things be his heirs; but whofe right of inheritance may be defeated by the contingency of fome nearer heir being born: as a brother or nephew, whofe prefumptive fucceffion may be deItroyed by the birth of a child: or a daughter, whofe prefent hopes may be hereafter cut off by the birth of a fon. Nay, even if the eltate lath defcended, by the death of the owner, to fuch a brother, or nephew, or daughter; in the former cafes, the elfate fhall be devefted and taken away by the birth of a polthmous chitd; and, in the latter, it thall alfo be totally divetted by the birth of a polthumous fon.

We muft alfo remember, that no perfon can be properly fuch an anceftor as that an inheritance in lands or tenements can be derived from him, unlefs he hath had actual feifin of fuch lands, either by his own entry, or by the poffeffion of his own or his anceftor's leffee for years, or by receiving rent from a leffee of the frethold: or unlefs he hath what is equivalent to corporal feisin in hereditaments that are incorporeal ; fuch as the receipt of rent, a prefentation to the church in cafe of an adrowfon, and the like. But he fhall not be accounted an anceftor who hath had only a bare right or title to enter or be otherwife feifed. And thesefore all the cafes which will be mentioned in the prefent article, are upon the fuppofition that the deceafed (whofe inheritance is now claimed) was the laft perfon actually feifed thereof. For the law requires this notoriety of poffeffion, as evidence that the ance. flor had that property in himfelf, which is now to be tranfmitted to his heir. Which notority hath fucceeded in the place of the ancient feodal inveriture, whereb,y, while fouds were precarious, the vaffal on the defeent of las ds was formerly admitted in the lord's court (as is Alll the practice in Scotland): and therefore recrived his feifm, in the nature of a renewal of his anceftor's grant, in the prefence of the feodal peers: till at length, when the right of fucceffion became indefeaEible, atr entry on any part of the lands within the county (which if difputed was afterwards to be tried by thofe peers), or other notorious poffethon, was admitied as equivalent to the formal grant of feitin, and made the temant capable of tranfinitting his ellate by defeent. The feifin therefore of any perfon, thus undertood, mokes him the root or Atock from which all fu:ture inheritance by right of blood mut be derived; which ir very biefly exproffed in this maxim, ferfona fir

When therefore a perfon dies to feifed, the inheri- Defient. tance firlt goes to his iffue: as if there be Geoffrey, John, and Matthew, grandfather, father, and fon; and John purchafes land, and dies; his fon Matthew fhall fucceed him as heir, and not the grandfather Geoffrey; to whom the land fhall never afeend, but fhall rather efcheat to the lord.
2. "The male iffue fhall be admitted before the female." - Thus fons thall be admitted before daughters; or, as our male lawgivers have fomewhat unconmplaifantly expreffed it, the worthief of blood thall be preferred. As if John Stiles hath two fons, Matthew and Gilbert, and two daughters, Margaret and Charlotte, and dies; firf Matthew, and (in cafe of his death without iffue) then Gilbert, fhall be admitted to the faccelhon in preference to both the danghters.
3. "Where there are two or more males in equal degree, the eldeft only fhall inherit; but the females all together."-As if a man hath two fons, Matthew and Gilbert, and two danghters, Margaret and Charlotte, and dies; Matthew his eldett fon fnall alone fucceed to his eftate, in exclution of Gilbert the fecond fon and both the danghters; but if both the fons die without iffue before the father, the daughters Mergaret and Charlotte thall both inherit the eftate as coparceners.
4. "The lineal defcendants, in infuitum, of any perfon deceafed, hall reprefent their anceftor; that is, fhall fland in the fame place as the perfon himfelf would have done had he been living."--Thus the cliild, grandchild, or great-grandchild (either mate or female), of the eldelt ion, fucceeds before the younger fon, and fo in infinitum. And thefe reprefentatives fhall take neither more nor lefs, but jull fo much as their prancipals would have done. As if there be two lifters, Margaret and Charlotte ; and Margaret dies, leaving fix daughters; and then John Stiles the father of tlee two finters dies withont other iffue: thefe fix daughters fhall take among them exactly the fame as their mother Margaret wonld have done had the been living ; that is, a moiety of the lands of John Stiles in coparcenary : fo that, upon partition made, if the land be divided into twelve parts, thereof Charlote the fursiving fiter thall have fix, and her lix nieces, the daughters of Margaret, one a-piece.
5. "On failure of tineal defcendants, or iffue, of the perfon latt feifed, the inheritance fhatl defcend to the blood of the firlt purchafer ; fubject to the three preceding rules." -Thus, if Geoffrey Stiles purchafes land, and it clefeends to John Stiles his fon, and John dies feifed thereof without iffue; whoever fucceeds to. this inderitance mult he of the blood of Geoffrey the firl purchafer of this family. The firt purchafer, ptrqufitor, is he who firfl acquired the eftate to his family, whether the fame was transferred to him by fale, or by gift, or by any other method, except only that of deficent.
6. "The collateral heir of the perfon laft feifed muft be his next collateral kinfman of the whule blood."

Fint, he mult be his next cullateral kinfman eithen perfonally or jure reprefentationis: which proximity is ruckord according to the canonical degrets of con-fanguinity: See Consangunary. Therefore, the brother being in the firll degree, he and his defeendauts thall exclude the uncle and his ifue, who is only.
his eftate flall defcend to Francis his brother, who is lineally defcended from Geoffrey Stiles his next immediate anceftor or father. On failure of brethren or fifters and their iffue, it flall defeend to the uncle of John Stiles, the lineal defcendant of his grandfather George; and fo on in infuitum.

Bur, feeondly, the heir need not be the nearell kinf. man abfolutely, but only fub moto; that is, he munt be the nearell kiniman of the eulode blood: for if there be a much nearer kinfinan of the bulf blood, a dittant kinfman of the whole blood fitall be admitted, and the other entirely excluded. - A kinfman of the whole blood is he that is derived, not only from the fane anceftor, but from the fame couple of anceltors. For as every man's own blood is compounded of thie bloods of his refpective ancefors, he only is properly of the whote or entire blood with another who hath (fo far as the dillance of degrees will permit) all the fame ingredients in the compolition of his blood that the other hath. Thus, the blood of John stiles being compofed of thofe of Geoffry Stiles his father, and Lucy Baker his mother, therefore his brotirer Francis, being defended from both the fame parents, hath entirely the fame blood with Jolm Stiles; or he is his brother of the whole blood. But if, afyer the death of Geoffrey, Lucy Baker the mother marries a feeond hufband, Lewis Gay, and hath iffuc by him: the blood of theis: ifue, being compounded of the blood of Luicy Baker (it is true) on the one part, but that of Lewis Gay (intead of Geoffrey Stiles) on the other part, it hath therefore only half the fame ingredients with that of John Stiles; fo that he is only his brother of the half blood, and for that reafon they hall never inherit to each other. So alfo, if the fathicr has two fons, $A$ and $B$, by different venters or wives; now thefe two bethren are nut brethren of the whole blood, and therefore thall never inherit to each other, but the ethate thall rather efcheat to the lord. Nay, even if the father dies, and his lands defeend to his eldelt fon $A$, who enters thereon, and dies feifed without ithue; Atill B fall not be heir to this entate, becaufe he is only of the half blood to $A$, the perfon laft feifed: but had A died without entry, then B misht bave inherited: not as heir to A his half-brother, but as heir to their common father, who was the perfon laf acteally feifed.

The rule then, together with its illuftration, amounts to this, That in order to keep the ellate of John Stiles as nearly as polthble in the line of his purehafing aneefor, it mull defend to the iffue of the neareft couple of aneeltors that have left defeendants behind them; becaufe the difiendants of one anceltor only are not fo likely to be in the line of that purchating ancellor as thofe who are defcended from two.

But here a difficulty alifes. In the fecond, third, fourth, and every faperior degiee, evers man has many couples of ancettors, inereating aceording to the ditanecs in a geometrical progrthion upwards, the defeendants of all whici refpective couples are (reprefentatively) related to him in the fame degree. Thum, in the fecond degree, the ifue of George and Cecilia Biles and of Audrew and Fither Baker, the two grandires and grandmothers of Jobn Stics, are each in the fanc degree of propi:gquity; in the thind degree, the refective iffues of Water and Cluiftian Stiles, of

Luke and Francis Kempe, of Herlert and Hanmah Defent.
Baker, and of James and Emma Thorpe, are (upon the extinction of the two infcrior degrees) all c. qually intitled to call themfelves the next kindred of the whole blood to John Stiles. To which therefore of thefe anceltors mult we firt refort in order to find out defeendants to be preferably called to the inheritance? In anfiver to this, and to aroid the confution and uncertainty that might arife between the fevcral llucks wherein the purchating ancetlor may be fought for,
7. The feventh and lat rule or canon is, "that in collateral inheritances the male flocks flall be preferred to the female (that is, kindred derived from the blood of the male ancelfors thall be admitted befure thofe from the blood of the femate) ; -unlefs where the lands have in fact defcended from a female.". Thus the relations on the father's fide are admitted in infinitian, before thofe on the mother's fide are admitted at all; and the relations of the father's father, before thofe of the father's mother; and fo on.
For the original and progrefs of the above canonc, the reafons upon which they are founded, and their agreement with the laws of other nations, the curious reader may confult bibucklone's Commentaries, Vol. 11. p. 208-237.

We hall conclude with exemplifying the rules themfelves by a fhort fketch of the manner in whieh we mult frarch for the beir of a perion, as John Stiles, who dies feifed of land which he aequired, and which therefore he held as a feud of indetinite antiquity. See the Tabis of Descents on Plate CLVI.

In the firlt place fuceeeds the elder fon, Matthery Stiles, or his iffue, ( $\mathrm{n}^{\circ} \mathrm{I}$ ) : - if his line be extinct, then Gilbert Stiles and the other fons refpectively, i: order of birth, or their iffue, ( $n$ 2. ):-in default of thefe, all the daughters together, Margaret and Charlutte Stiles, or their iffuc, $\left(\mathrm{n}^{\circ} 3\right)-\mathrm{O}_{1}$ failure of the defeendants of John Stiles himfulf, the iflue of Gcolfrey and Luey Stiles, his parents, is called in: viz. firt, Francis Stiles, the eldeft brother of the whole bluod, or his iffue, $\left(\mathrm{n}^{\circ} 4.\right)$ :-then Oliver Stiles, and the other whole brothers refpectively, in order of biitli, or their iffue, ( $n * 5$.):-then the fiters of the whole blood all together, Bridget and Alice Stiles, or their iffue, ( $n^{\circ} 6$.) - In defect of thefe, the iffue of Ceorge and Cecilia stiks, his father's parents; refpect being till had to their age and fex, $(n, 7)$ ):-then the iffue of Walter and Chriftian Stiks, the parents of his pas terual grandfather, ( $\mathrm{n}^{5} 8$. : :- then the iffue of Richand and Ame Stiles, the parents of his paterual grandf.ther's father, ( $n^{\circ} 9$.):- -and fo on in the paternal grand fathicr's paternal line, or blood of Walter Stiles, in is, finitum. In defect of theic, the iffice of William and Yene 'Sonith, the parents of his paternalkrandfather's mothor", ( $\mathrm{n}^{\prime} \mathbf{1} \mathbf{\circ}$.): - and fo on in the faterual grandfather's man ternal line, or blood of Chaitian Simith, in infiniturn; till both the immediate bloods of Ceorge Stiles, the pdo ternal grandiather, are fernt. - Then we mut iefort to the irue of Luke and Frances Kempe, the parcats of Jobn Stiles's raternal grandmother, ( 1 - 11. ):-then to the illue of Thomas and Sarah Kenipe, the parent, of his paternal grandmother's father, ( $1^{\circ} 12$. ) :-and fo on in the patenal groudnother's patemal line, or bloud of lake Kcmpe, in infinitum. In defalte of

Defent which, we mukeall in the itue of Charles and Mary
Holland, the parents of his patemad grambuther's muther, ( $n^{\prime 2} 13 .!2$ and 50 on in the patemal grand-
mothe's materat liec, or huod of trances Fulland, in ingintan: till both the immediate bloods of Cerilia Kempe, the paternal grandmother, are athe pent... Whereby the paternat hood of Johin Stiks atioly failing, recourle muth then, and not before, be hed to his materual delations; or the blund of the baters, ( $\left.n^{\circ} 1+15,16.\right)$, Whilis's ( $n^{\circ} 17$. ), Thorpe's ( $n^{\circ}$ 18, 10.), and White's ( $n^{\circ} 20$.) ; in the fame regular fucecliise order as in the patermal line.

The ftudent hould bear in mind, that during this whole procets, John Stiles is the perfon lippoled to have been lat actually fieifed of the eftate. For if ever it comes to velt in any other perfon, as heir to Jobn Stiles, a new order of fuccefion mull be obferved upon the death of fuch heir; lince he, by his own leilin, now becomes himfelf an ancettor, or fliges, and mult be put in the place of John Stiles. The higures therefore denote the onder in which the fereval clates would fucceed to John Stiles, and not to each other : and he= fote we fearh for an heir in any of the higher tigures, (as $n^{\circ} \mathrm{g}$.) we matt be linit aflared that all the lower claffes (from $n^{2} 1$ to 7 .) were extinct at John Stiles's deceafe.

Descent, or Surcefon, in the law of Scotland. See Lenw, Part Ill. N clixx. chxix.

Drscent of the Crach. See Succession.
Descent of Dignitios. A dignity difiers from common inheritances, and goes not according to the rules of the common law: for it defeends to the half-blood; and there is no copacenerfhip in it, but the eldetl takes the whole. The dignity of peecagre is perfonal, annexed to the blood; and for infeparable, that it cannct be transferred to any perfon, or furrendered even to the crown: it can move neither forwand nor backward, but only downward to pofterity; and nothing but corruption of blood, as if the anceftor be attainted of treafon or felony, can hinder the defeent to the righe heir.

Descent, in genealogy, the order or fucceffion of defeendants in a line or family; or their ditance from a common progenitor: Thus we fay, one defcent, two defcents, \&ic.

Descent, in heraldry, is ufed to exprefs the coming down of any thing from above; as, a lion en defcent is a lion with his head towards the bafe points, and his heels towards one of the corners of the chief, as if he were leaping down from fome high place.

DESCHAMPS (Francis), a French poet, born in Clampagne, was the author of a tragedy intitled Cato of Utica, and a liftory of the French theatre. He died at l'aris in 1747 .

DESCRIPTION, in literary compolition, is fuch a flrong and beantiful reprefontation of a thing, as gives the reader a didtinct view and fatisfactory notion of it. See Nimbition and Defoription.
I)ESEADA, or Desidfrara, one of the Caribbee iflands, fubject to France, lying eallward of Guadaloupe.

DESERT, or Desart. See Desart.
DESERTER, in a military Cenle, a foldier who, by running away from his regiment or company, aLandons the fervice.

A deferter is, by the articles of war, punifmable by
death; which, after conviction, is executed upon him Defertion at the head of the regiment he formerly belonged to, with his crime written on his breat.

1) figa.

DESKRJTON, in law. Sce Law, Ne cle. 24 .
DEsIABMISLE, a French term, naturalized of late. It poperly lignitics a nightoguwn, and other neceffain, male nie of in dreffing or matrefig. Mr .... is not to be flooken with, he is yet in his deflomliuit, i. e. undrefled or in his night-gown. The word is compounder of the privative de and s'bediller, "to drets ontes lule"

DELSHACHE, in heraldry, is where a teat has its limbs feparated from its budy, fo that they flill remain on the efoutcheon, with onty a fmall teparation from their natural places.

DESIDERATUNA, is ufed to fignify the defrable perfections in any art ar focence: thus, it is a defideratum with the blacklinith, to reader iron funble by a gentle beat, and yet preftree it hard enough for ondinary ufes; with the glafemen and looking-glafs maker, to ruder glafs malleable: with the cluck-maker, to bring pendulams to be ufeful where there are irregular mutions, \&c.

DESIGN, in a general fenfe, the plan, order, repredentation, or condruction of a buiding, book, painting, \&c. See Archite ture, Painting, Poetry, Oratory, and History.

Des:cx, in the manutactories, expreffes the figures wherewith the workman entiches his ant or hak, and which he copies after fome painter or emincut draught fman, as in diaper, damafk, and other fowered bilk and tapeftry, and the like.

In madertaking of fuch kinds of figured fuffs, it is necefary, fays Monf. Sanary, that, befure the irit floke of the thuttle, the whole difign be reprefented on the threads of the warp, we do not mean in colours, but with an intinite number of lithe packthreads, which, being difpoted fo as to raile the threads of the warp, lat the workmen lee, from time to time, what kind of filk is to be put in the eye of the thattle for woof. This method of preparing the work is edled rearing the delign, and ecolitag this figure, which is performed in the following manner: A paper is proviód, contiderably browhr than the Ituff, and of a length proportionate to what is inteaded to be repreiented thereon. 'Jhis they divide lengthwife, by as many black lines as there are intended throads in the warp; and crofs the fe lines, by uthers drawn breadthwife, which, wibl the fumer, make litule equal tquares; on the paper thas fquared, the draughtiman detigus his ligures, and heightens them with colours as he fees fit. When the denge is finifued, a workman reads it, while another lays it on the dimblot.

To read the delign, is to tell the perfon who manages the loom, the number of fquares on threads comprifed in the face he is reading, intimating at the fame time, whether it is ground or higure. To put what is read on the fimblot, is to fallen litile drings to the foveral packthreads, which are so raife the threads named; and this they continue to do till the whole defign is read.

Every picce being compofed of feveral repetitions of the fane delign, when the whole delign is diawn, the drawer, to re-begin the defiga afreth, has nothing to du but to raife the litte ftings, with Slip-knots, to the

Defign top of the fimblot, which he liad let down to the bottom: this he is to repeat as often as is necelfary thll the whole be manufacturca.
The ribbon-weavers have likewife a defign, but far more limple than that now deferibed. It is drawn on paper with lines and fquares, reprefenting the threads of the warp and woof. But inttead of linas, whercof the figures of the former confill, thefe are conitituted of points only, or dots, placed in certain of the litule fquares formed by the interfection of the lines. Thefe points mark the threats of the warp that are to be mifed, and the faces left blank denote the threads that are to keep thicir fituation: the reft is managed ao in the former.

Desigv is alfoufed, in painting, for the firf idea of a large work, dawn ronghly, and in litte, with an intention to he executed and failhed in large.

In this ferfe, th is the fimple contour or outlines of the ligures intended to be reprefented, or the lines that terminate and circumforibe them: fuch defign is fornctimes drawn in crayons or ink, without any thadows at all ; fometines it is hatched, that is, the fhadows are exprefied by fenfible outlines, wially drawn acrofs each other with the pen, crayon, or graver. Sonetimes, arain, the thadows are done with the crayon rubbed fo as that there do not appear any lines: at other times, the grains or itroke of the crayon ap. pear, as not being rubbed: fometires the defign is wathed, that is, the fhadors are done with a pencil in Indian ink, or fome other liguor: and fornetimes the defign is coloured, that is, colours are laid on much like thofe intended for the grand work.

Deston, in mufic, is juifly defince by Rouficau to be the invention and the conduct of the fubject, the difpofition of every part, and the general order of the whole.

It is not fufficient to form beautiful airs, and a legitimate harmony; all thefe mule be conncied by a priucipal fulbect, to which all the parts of the work relate, and by which they become one. Thus unity ought to prevail in the ais, in the mutement, in the character, in the harmony, and in the medulation. Alt thefe mut indifpenfably relate to one conmon idea which unites them. The greatel difficulty is, to recoucile the obfervation of thofe precepts with an clegrant varicty. which, if not introduced, renders the whole picce irkfome and monotonic. Without queftion, the mufcian, as well as the poet and the painter, may rifk every thing in favour of this delightful varicty; if, under the pretest of contrafting, they do not endeavour to cheat us with falfe appearances, and inflead of pieces juflly and happily planned, prefent us with a mufical minced meat, compofed of little abortive fragments, and of characters for incompatible, that the whole aftembled forms a heterogeneous montter.

$$
\begin{aligned}
& \text { Non nt placidis creant insmbic, now ut }
\end{aligned}
$$

Tranflated thus:
Rut not that nature thould revers'l ajpear;
Mhix mild wifh force, and gethle whth fevere;
Profane her haw eco conradioticn' neight;
'Syzers with lumbs, with ferquars bitis unte.
It is therefore in a diftribution formed with intelligence and tafte, in a jult proportion between all the parts, that the perfection of defign confints; and it is
above all, in this point, that the imnorta Pergolefo has Defign:foown his judmment and his tafte, and has left fo far behind him al his competitors. I-is Siathot Aloter, twin 11 his Orfor, his Serva Padrona, are, in three difflectit ficecies of compolition, three mallerpieces of $d y / y^{\prime}$ equal$1 \%$ perfect.

This idea of the gencral defign of a work is likewife particularly applicable to every piece of which it comtits; thus the comporor ploms an air, a duct, a chorus, \&c. For this purpofe, after heving invened his lubject, he dill ributes it, according to the ruks of a legitionate modulation, into all the parts where it cught to be perceivel, in fuch a proportion, that its impreffion may not be lott on the minds of the aullience; yet that it may never be recterated in their cars, without the graces of novelty. The compofer ens in deligning who fuffers his fubject to be forgot; he is ftill incre culpable who purfues it till it becomes trite and tireforne.

DESIGNATION, the act of marking or indicating, and making a thing known. The defignation of fuch an ellate is tnade by the teriants, butments, and boundings. Among the Romans, there were defignations of the confuls and other magitrates, fome time beforc their election.

DESIGNATOR, a Roman officer, who afligned and marked each perfon his place and rank in public ceremonies, thows, proceffions, \&c. The word is formed from the verb dififstare, to defign.

The defignator was a kind of marflal, or mafter of the ceremonics, who regulated the feats, march, order, \&c. There were defignators at funeral folemnities, and at the games, theatres, and hows, who not only affigued every one his place, but alfo led him to it; as appears fiom the prologue to the Pcenulus of Plantus. Much of the fame nature were the arevethetio of the Grocks.

DESIGNING, the art of delineating or drawing, the appearance of natural ohjeets, by lines, on a plans. To defign, according to the rules of mathematics, makes the object of perfpedtive. See Perspective.

DESPORTES (Francis), a French painter of the 18th century, was torn in Champagre in 1651. He acquired great reputation, not only in France, but in England and Poland: he particularly excelled in fill life. He was received into the academy of painting, made pictures. for the tapeftry of the Gobelins, and died at Paris in 1743.

DESPOT, a term fometimes ufed for an abfolute prince: (fee the next article). The word, in its firlt origin, flynified the fame with the Latin berus, and the Englifh mafer: but in time it undcrwent the fame fate on medalk, as, among the Latins, Cefar did with regard to Augufus; bacharycanfweringto Augufus, and $\Delta$ bciothé, defpefes, to Cafar. See Caxs.ar. Thus, Nicephorus having ordered his fon Stauracius to be crowned, the fon, out of refpect, would only take the name amemotac, leaving to his father that of bacharc. For it is to be noted, that it was julf abont the time that the emperors legan to ceafe to ufe Latin inferiptions. This delicacy, however, did not laft long; for the following emperors preferred the quality of $\triangle E C-$ mothe to that of baciaetc, particularly Conflantine, Michacl Ducas, Nicephorus Botoniates, Romanus Diogenes, the Comucni, and fonse others. In imitation

## D E S

Defpot imitation of the princes, the princeffes likewife af H Defiutor. fumed the title of $\triangle$ ECROIN.
It was the emperor Alexius, furnamed the Angel, that created the dignity of defpot, and made it the firit after that of emperor, above that of Augulus or Sehaftocrator and Cxfar. See August.

The defpots were ufually the emperors fons or fons-in-law, and their colleagues or copartners in the empire, as well as their prefumptive heirs. The defpots that wete fons of the emperors had more privileges and authority than thofe that were only fons-in-law. Codin. F. 38. defcribes the habit and ornaments of the defpot. See the notes of father Goar on that author. Under the fucceffors of Conflantine the Great, the title defot of Sparta was given to the emperor's fon or brother, who had the eity of Sparta or Lacedemon by way of apannege.

Despor is at prefent a title of quality given to Wallachia, Servia, and fome of the neighbouring countries.

DESPOTICAL, in general, denotes any thing that is uncontrolled and ablolute; but is particularly uied for an arbitrary goverument, where the power of the prince is unlimited, and his will a law to his fubjects: fuch are thofe of Turky, Perfia, and moft of the caftern governments; and even thofe of Europe, if we exctpt the republics, our own, and of late the French government.

DESPOUILIE, in heraldry, the whole cafe, fkin, or flough of a beat, with the head, feet, tail, and all appurtenances, fo that being filled and Ituffed it looks like the entire creature.

## despreaux. Sec Boileau.

DESSAW, a city of Upper Saxuny, in Germany, fituated on the river Elbe, 60 miles north-wed of Drefden, and fubject to the prince of Anhalt Deffaw. E. Long. 12.40. N. Lat. 5 I. 50.

DESSERT, or Desert, a fervice of fruits and fweetmeats, ufually ferved up laft to table.

Dessiccative, or Desiccative, in pharmacy, an epithet applied to fuch topical medicines as dry up the humours flowing to a wound or ulcer.

Destinies, in mythology. See Parce.
DESTINY, among philofophers and divines. See Fate.

DESTRUCTION, in general, an alteration of any thing from its natural flate to one contrary to nature; whereby it is deemed the fame with Corruption.

A chemical deftruction, or corruption, is nothing but a refolution of the whole naturally mixt body into its parts.

DESUDATION, in medicine, a profufe and inordinate fweat, fucceeded by an eruption of puftules, called fustamina, or beat pimples.

DESULTOR, in antiquity, a vaulter or leaper, who, leading one horfe by the bridk, and riding another, jumped from the back of one to the other, as the cuilom was after they had run feveral courfes or heats. -This practice required great dexterity, being performed before the ufe of cither faddles or Airrups. The cuftom was practifed in the amy when necelify required it ; but chich; amongft the Numidians, who dhays carried with then two horfes at lealt for that purpufe, changing them as they tired. The Greeks and Romans borrowed the practice from them; but only ufed it at races, games, \&c. The Samate were
I: $1=0$.

## D E T

DETACHMENT, in military affairs, a certain number of foldiers drawn out from feveral regiments or companies equally, to be employed as the general thinks proper, whether on an attack, at a fiege, or in parties to foour the country.

DETENTION (from detineo "I detain"), the poffeffion or holding of lands, or the like, from fome other claimant. The word is chichly ufed in an ill fenfe, for an mjuft with-holding, \&c.

DETENTS, in a clock, are thofe fops which, by being lifted up or let fall down, lock and unlock the clock in Atriking.

Detent-IVhech, or Hoop-zubeel, in a clock, that wheel which has a hoop almolt round it, wherein there is a vaeancy, at which the clock locks.

DETERGENTS, in pharmacy, fuch medicines as are not only foftening and adhefive, but alfo, by a peculiar activity, conjoined with a fuitable configuration of parts, are apt to abrade and carry along with them fuch particles as they lay hold on in their paflage.

DETERIORATION, the impairing or rendering any thing worfe: it is juft the reverfe of melioration.
DETERMINATION, in meehanics, fignifies much the fame with the tendency or direction of a body in motion. See Mechanics.

Determination, among fchool-divines, is an act of divine power, limiting the agency of fecond caufes, in every inflance, to what the Deity predeftinated concerning them. See Predestination.
Detersives, the fame with Detergents.
DETINUE, in law, a writ or action that lies againt one who has got goods or other things delivered to him to keep, and afterwards refufes to deliver them.-In this action, the thing detained is generally to be recovered, and not damages; but if one cannot secover the thing itfell, he fhall recover damages for the thing, and alfo for the detainer. Detinue lies for any thing certain and valuable, wherein one may have a properity or right ; as for a horfe, cow, fheep, hens, dogs, jewels, plate, cloth, bags of money, facks of corn, \&c. It mult be laid to certain, that the thing detained may be known and recovered: and therefore, for money out of a bag, or corn out of a fack, \&c. it lies not; for the money or corn camnot in this cafe be known from other money or corn ; fo that the party mult have an action on the cafe, \&c. Yet detinue may be brought for a piece of gold of the price of 22 s . though not for 22 s . in montey.

DETONATION, in chemifty, fignities an explofion with noife made by the fadden inflammation of fome combutible body: Such are the explotions of gun-powder, fulminating goll, and fulminating powder. As nitre is the caufe of moft explofions, the word detonation has been appropriated to the inflammation of the acid of this falt with bodies containing phlogiton; and it is frequently given to thofe inflammations of nitrous acid which are not arcompanied with explotion. Thus nitre is faid to detonate with fulphur, with coals, with metals; althongh in the ordinay y method of making thefe operations, that is, in open crucibles, and with fmall quantities of detonating fubitances, the nitre does not truly explode. See Nitre.

DETRANCHE, in homary, a line bend-wife,

DEVA, or Devina (anc. geog.), a town of the Cornavii in Britain. Now Chefler, on the Dee. W. Loug. 3. Lat. 53. 15.

DEUCALEDONIUS OcEaNUs, or (which comes nearer the original pronunciation) Duacaledonius, fo called from Diab Gael, the northern Highlanders: the fea on the north-wett of Scotland.

DFUCALIOY, king of Theflaly. The food faid to have happened in his tirit ( 1500 B. C.), is fup. pofed to have been only an inundation of that comntry. oceafoned by heary rains, and an earthquake that fopped the courle of the river Peneus where it ufually difcharged itfelf into the lea. On thefe circumftances the fable of Dencalion's flood is founded. -According to the fable, he was the fon of Prometheus. He governed his people with equity ; but the reft of mankind being extremely wicked, were detroyed by a flood, while Deucalion and Pyrrha his queen faved themfelves by afcending mount Farnaxus. When the waters were decreafed, they went and confulted the oracle of Themis, on the means by which the earth was to be repeopled; when they were ordered to veil their heads and faces, to unloofe their girdles, and throw behind their backs the bones of their great mother. At this alvice Pyrrha was feized with horror: but Deucalion explained the mytterg, by obferving, that their great mother mut mean the earth, and her bones the fones; when taking them up, thofe Deucalion threw over his head became men, and thofe thrown by Pyrtha, women.

Some have fuppofed that Deucalion, whom the Greeks have reprefented under a varicty of characters, and concerning whom their poets have given many fabulous accounts, was the fame with the patriarch Noah; and that Deucalion's flood in 'Theffaly, as well as that of Ogyges in Attica, and of Prometheus in Egypt, were the fame with that of Noah recorded in fcripture. Diodorus Siculus exprefsly fays, that in the deluge which happened in the time of Deucalion almolt all flefr died. Apollodorus having mencioned Deucalion ev-rafvex, "contigned to as ark," takes notice, upon his quitting it, of his offering up an immediate facrifice, $\Delta u$ zunt, " to the Ged who detivered him." As he was the father of all mankind, the ancients have given him great dignity and univertal monarchy: though fometimes he is reduced to a petty king of Theflaly. Apollonius Rhorlius makes him a native of Crecec, and the fon of Prometheus. IVe nay learn, however, from their confufed hiftory, that the perfon reprefented was the farit of men, through whom religious rites were renewed, entics built, and civil polity ctablifhed in the world: none of which circumfances are applicable to any king of Greece. Philo affures ue, that the Grecians call the perfon Deucalion, but the Chaldeans fyle him Noc, in whofe Lime there happened the great cruption of waters.

[^26]But as Lucian has given us the mon particuiur hinory Deas a"on of the deluge, and that which comes nearelt to the account given by Mofes; and as he was a native of Deveteos Samofata, city of Commene upon the Euphates, Samofata, a city of Commagene upon the Euphates, 2.: 1). 3 a part of the world where memorials of the delugeria volo: were particularly preferved, and where an obvinnt re-p 8 \& ference to that hiftory may be olferved in the rites and worthip of the comiry, we flall give the following extract of what he fays on the fubject. Having deferibed Noah under the name of Deucalion, he fays, that the prefent race of mankind are different from thofe who firl exifted; for thofe of the :mtechluvian world were all deftroyed. The prefent world is perse pled from the fons of Deucalion; having increaled to fo great a number from one perfon. In refpect to the former brood, they were men of violence, and lawlefs in their dealings. They regarded not oaths, nor obferved the rites of hofpitality, nor fhowed mercy to thofe who fued for it. On this account they were doomed to deltruction; and for this parpofe there was a mighty eruption of waters from the earth, attended with heavy thowers from above; fo that the rivers fwelled, and the fea overflowed, till the whole carth was covered with a flood, and all Hefl drowned. Deucalion alone was preferved to repeople the world. This mercy was thown to him on account of his juflice and piety. His prefervation was effected in this manaer: he put all his family, both his fons and their wives, into a valt ark which he had provided, and be went into it himfelf. At the fane time animals of every fpecies, boars, horfes, lions, ferpents, whatever lived upon the face of the earth, followed him ty pairs ; all which he received into the ark, and experiencd no evil from them; for there prevailed a wonderful harmony throughout by the immediate influence of the 1)eity. Thus were they wafted with him as loner as the flood endured. After this he proceeds to mention, that upon the difappearing of the waters Deucalion went forth from the ark and raifed an altar to God.

Dr Bryant produces a variety of monuments that bear an obvious reference to the deluge in the Gontile hiftory, belides this account of Deucalion and his flood, Analyfis of Arncient Mythology, vol. ii. p. 193-250.

## DEVENSHRING. See Devonsheering.

DEVENTER, a large, ftrong, traditg, and populous town of the United Provinces in Overyffel, with an univerfity. It is furrounded with ftrong walls, Alanked with feveral towers, and with ditches full of water. It is ferted on the river Iffel, 55 miles eaft of Amiterdam, and 42 weft of Benthem. E. Long. 5.8. N. Lat. 52. 18.

DEVEREUX (Robert), earl of Eflex, the fon of Walter Deverenx, vifcount Hereford, was born at Nctherwod in Herefordhire, in the ycar 1567 . He fucceeded to the title of earl of Erex at ten years of age; and about two years after, was fent, by his guardian lord Burleigh, to Trinity-college in Cambridge. He took the degree of matter of arts in 1582 , and foon after retired to his feat at Lampfie in South-Wrales. He did not however continue long in this retreat; for we lind him, in his feventeenth year, at the caurt of queen Elizabeth, who immediately honoured him with fingular marks of her favour. Authors feem very unneceffarily perplexed to account for this young earl's

D E V
Devertux. gracions reception at the court of Elizabcth. The reafons are olvious: he was her relation, the fon of one of her moft faithful fervants, the fon-in-law of her favourite Leicefter, and a very handfome and accomplifhed youth. Towatds the end of (the following year) 5585 , he attended the earl of Leicefler to Hulland; and gave fignal proofs of his perfonai courage during the campuign of 1586 , particularly at the battle of Zutphen, where the gallant Sidney was mortally wounded. On this occation the earl of Leiectler conferred on him the honour of knight banneret.

In the year 1587 , Leicelter being appointed lord feward of the houfelold, Effex fucceeded him in the honourable pott of matter of the horfe; and the year following, when the queen affembled an army at Tilbury to oppofe the Spanilh invafion, Effex was made gencral of the horfe. From this time he was confidered as the happy favourite of the queen. And, if there was any mark yet wanting to fix the people's opinion in that refpect, it was fhown by the queen's conferring on him the honour of the garter.

We need not wonder, that fo quick an elevation, and to fo great a height, flould affect fo young a man as the earl of Effex; who thowed from leenceforwards a very ligh firit, and often behaved petulantly enough to the queen herfelf, who yet did not love to be controlled by her fubjects. His eagernefs about this time to difpute her favour with Sir Charles Blunt, afterwards lord Montjoy and earl of Devonfhire, coft him fome blood; for Sir Charles, thinking himfelf affronted by the earl, challenged him, and after a hoit difpute, wounded him in the knee. The queen, fo far from being difpleafed with it, is faid to have fworn a good round oath, that it was fit fomebody fhould take him down, otherwife there would be no ruling him. However, fhe reconciled the rivals; who, to their honour, continued good friends as long as they lived.

The gallant Effex, however, was not fo entirely captivated with his fituation, as to become infenlible to the : Alurements of military glory. In 1589 , Sir John Norris and Sir Francis Drake having failed on an expedition againft Spain, our young favourite, without the permifion or knowledge of his royal mittrefs, followed the fleet; which he joined as they were failing tuwards Libon, and acted with great refolution in the repulfe of the Spanilh garrifon of that city. The queen wrote him a very fevere letter on the occafion; but the was, after his return, foon appeafed. Yet it was not long before he again incurred her difpleafure, by marrying the widow of Sir Philip Sidney. In 1591 , he was fent to France with the command of 4000 men to the affiftance of Henry IV. In 1596, he was joined with the lord high adninal Howard in the command of the famous expedition againft Cadiz , the fuccefs of which is miverfally known. In 1597, he was appointed maller of the ordnance; and the fame year commanded another expedition againt Spain, called the Ifland voyare, the particulars of which are alfo well known.

Soon after his return, he was created earl marfhal of England; and on the death of the great lord Burleigh, in 1598 , elected chancellor of the univerfity of Cambridge. This is reckoned one of the latt intances of this great man's felicity, who was now advanced too bigh to fit at eafe; and thofe who longed for his he-
nours and employments, very clofely applied them- Devereus. felves to bring about his fall. The tirtt great thock he received, in regard to the queen's favour, arofe frem a warm difpute between her majelty and limfelf, about the ehoice of fome fit and able perfons to fuperintend the aflairs of Ireland. The affair is related by Camden; who tells us, that nobody was prefent but the lord admiral, Sir Robert Cecil feeretary, and Windebank clerk of the feal. The queen looked upon Sir Williams Knolls, uncle to Effex, as the moft proper perfon for, that charge: Effex contended, that Sir George Carew was a much fitter man for it. When the queen could not be perfuaded to approve his choice, he fo far forgot himfelf and his duty, as to turn his back upon her in a contemptuous mamer; which infolence her majeity not being able to bear, gave him a box on the ear, and bid him go and be hanged. Effex, like a blockhead, put his hand to his fword, and fwore revenge. Where was his gatlantry on this oceafion? Could a ftroke from an angry woman tinge the honour of a gallant foldier? This violent ftorm, however, foon fubfided: and they were again reconciled, at leaft apparently.

The total reduction of Ircland being brought upon the tapis foon after, the earl was pitched upon as the only man from whom it could be expected. This was an artful contrivance of his enemies, who hoped by this means to ruin him; nor were their expectations difappointed. He deelined this fatal preferment as long as he could: but, perceiving that he fhould have no quiet at home, he accepted it ; and his commiffion for lord licutenant pafed the great feal on the 12 th of March 1598 . His enemies now began to infinuate, that he had fought this command, for the fake of greater things which he then was meditating; but there is a letter of his to the queen, preferved in the Harleian collections, which fhows, that he was fo far from entering upon it with alacrity, that he looked upon it rather as a banifhment, and a place affigned him for a retreat from his fovereign's difpleafure, than a potent government beftowed upon him by her favour. "To the Queen. From a mind delighting in forrow; " from fpirits walted with paffion; from a heart torn in " pieces with care, grief, and travail; from a man that "hateth himfelf, and all things elfe that keep him alive; " what fervice can your majelly expect, fince any fer"vice paft deferves no more than banifhment and pro"feription to the curfedeft of all iflands! It is your "rebels pride and fucceffion muft give me leave to ran" fons myfelf out of this hateful prifon, out of my " loathed body; which, if it happen fo, your majefty " fhall have no caufe to millike the fahion of my death, " fince the courfe of my life could never pleafe you.

[^27]"Robert Essex."
The.

## D E V

Devereux. The earl met with nothing in Ircland but ill fuc-- cefs and croffes: in the midit of which, an army was fuddenly raifed in England, under the command of the earl of Nottinglam ; nobody well knowing why, but in reality from the furgettions of the carl's enemies to, the queen, that he rather meditated an invation on his native country, than the reducion of the Lifh rebels. This and other confiderations made him refolve to quit his poft, and come over to England; which he accordingly did without leave. He burll into her majutty's bed-chamber as the was rifing, and fle received him with a mixture of tendernefs and feverity: hut the, foon after, thought lit to deprive him oí all his employments, except that of matter of the horfe. He was committed to the cultody of the lord-kceper, with whom he continued fix months. No fooner had he regained his liberty, than he was guilty of many extravagancies; to which he was intigated by knaves and fools, but pertaps more powerfully by his uwn palfions. Fle firlt deternined to obtain an audience of the queen by force. He refufed to attend the council when funmoned. When the queen fent the lord-keeper, the lord clief jultice, and two others, to know his grievances, he confined them; and then marched with his friends into the city, in expectation that the people would rife in his favour; but in that he was difappointed. He was at laft befieged, and taken in his houfe in Effex-Atreet ; committed to the tower; tried by his pees, condemned, and executed. Thus did this brave man, this favourite of his queen, this idol of the people, fall a facrifice to his want of that diffimulation, that cumning, that court-policy, by which his enemies were enabled to effect his ruin. He was a polite fcholar, and a generous friend to literature.

To thofe who have not taken the trouble to confult and compare the feveral authors. who have related the Ilory of this unfortunate earl, it mult appear wonderful, if, as hath been fuggefted, he was really beloved by queen Elizabeth, that fhe could conlent to his execution. Now that the had conccived a tender paffion for him, is proved beyond a doubt by Mr Walpole in his very entertaining and inftructive Cutalogue of Noble Autbors.-"I am aware (fays that author) that it is become a mode to treat the queen's paffion for him as a romance. Voltaire laughs at it ; and obferves, that when her fruggle about him muft have been the greateft (the time of his death), fhe was lixty-eight.-Had be been lixty-eight, it is probable fhe would not have been in love with him."-" Whenever Effex acted a fit of ficknefs, not a day paffed without the queen's fending often to fee him; and once went fo far as to fit long by him, and order his broths and things. It is recorded by a diligent obferver of that court, that in one of his fick moods, he took the liberty of going up to the queen in lis night-gown. In the height of thefe fretful fooleries, there was a mafk at Bhack Fryars on the marriage of lord Herbert and Mrs Ruffel. Eight lady-makkers chofe eight more to dance the meafures. Mrs Fitton, who led them, went to the queen, and wooed her to dance. Her majefty afked what fhe was? Affecion, fhe faid. Afecrion! faid the queen; Affection is falfe. Were not thefe the murmurs of a heart ill at cafe? Yet her majelty rofe, and danced. She was then fixty-eight. Sure it was as natual for her to be in love."

## 779 ] D E V

Mr Walpole farther olferves, that her court and so Deectine temporaries had an uniform niuiou of her paffion for Effex, and quotes fercral inflaces from a letter merit. ten by Sir Francic Bacou to the eal: in which, anomy other things, he walvifes him to confult her tate in his very appart and gettures, and to give way to anjo other inclination fle may have. Sir Francis advifed the queen herfilf, knowing her inclination, to keep the eath tbout her for focidy. What Henry IV. of France thourht of the qucen's affection for Effex, is evident foom what he faid to hor anstaffador-" Que fa motige ne hifle. roit jumais fon couffn "efex efloigner de fon cotillon." After his confinement, on hearing he was ill, the fent him word, with tears in her cyes, that if fle might with her honour, fhe would vilit him.
"If (fays Mr Walpole) theice intlances are prublematic, are the following fo? In one of the curious letters of Rowland White, he fay's, the queen buth of late ufed the fair MIrs Briliges with words and blows of anger. In a fubfequent letter, he fays, the carl is again failen in love cuith his fuireft B. It cannot choofe lut cum. to the queen's ear, and then be is undone:"-Efex himfulf fays, that her fond parting with him when he fet out for Ircland, pierced his very foul.

Probably the reader has now very little doubt as $t$, queen Elizabeth's affection for the unfurtunate Effex ; but, in proportion to our belicf of the exilance of this affection, her motives for confenting to his execution become more inexplicable. Queen Elizabeth had a very high opinion of her beanty and perfonal attractions, and probably expected more entire adoration than the earl's paffion for variety would fuffer him to pay. Towards the hatter end of her life, fhe was certainly an objcet of difgult. He had too much honett fimplicity in his nature, to feign a paflion which he did not feel. She fooliflly gave credit to the thories of his ambitious projects incompatible with her fafety; and was informed that he had once inadvertently faid, that Ree greau old and cankered, and tbat ber mind was become as crooked as ber carcafe. If this be true, where is the woman that would not facrifice fuch a lover to her refentment?

It is faid, however, that, concerning his execution, her inajefly was irrefolute to the laft, and fent orders to conntermand it ; but, conlidering hio obftinacy in refuting to afk her pardon, afterwards directed that he fhould die. It is reported, that the quetn, in the height of her paffion for the carl of Effex, had given him a ring, ordering him to keep it, and that whatever crime he fhould commit, the would pardon him when he fhould return that pledge. The earl, upon his condemnation, applied to admiral Howard's lady, his relation, defiring her, by a perfon whom fhe could truft, to return it into the queen's own hands; but her hufband, who was one of the earl's greateft enemies, and to whom fhe had imprudently toll the circumitance, would not fuffer her to acquit herfelf of the commiffion; fo that the queen confented to the earl's death, being full of indignation againt fo proud and haughty a fpirit, who chofe rather to die than implore her mercy. Sume time after, the adiniral's lady fell fick, and heing near her death, fhe fent word to the queen that the had fonething of great confequence to communicate before The died. The queen came to her bedfide, and having ordered all her attendants to withdaw, the lady rc-

Device turnei, but too late, the ring, defiring to be exculed that the did not return it fooner : on which, it is faid, the gueen immediately retied, overwhelmed with
grief.

The earl of Effex dicd in the thirty-fourth year of lis age; leaving by his lady one fon and two daughters.

## DEYTCE, among painters. See Devise.

DEVIL (Diabolus), an evil angel, one of thofe celeftial fpisits cait down from heaven for pretending to equal himflf with God. The Etir pians paint the devil white, to be even with the Europeans who paint him black.

There is no mention of the word devil in the Old Teftament, but only of the word Sutin and Belial: nor do we mect with it in any heathen authors, in the fenfe it is taken among Chriltians, that is, as a creature revolted from God Their theolugy went no farther than to evil genii or diemons.

Some of the American idulaters have a notion of two eollateml independent beings, one of whom is good, and the orher evil; whieh laft they imagine has the direction and fuperintendance of this earth, for which reafon they chiefly worthip him; whenee thofe that give us an account of the religion of thefe favages give out, with fome impropriety, that they worfhip the devil. The Chaldeans, in like manner, believed both a good prineiple and an evil one; which latt they inagined was an enemy to mankind.

Ifaiah, fpeaking, according to fome commentators, of the fall of the devil, calls him Lucifer, from his former elevation and flate of glory: but others explain this paffage of Ifaiah in reference to the king of Ba bylon, whol lad been precipitated from his throne and glory. The Arabians call Lucifer, Eblis; which fume think is only a diminutive or corruption of the word Diabolus.

Devil on the Neck, a tormenting engine made of iron, ftraitening and wincing the neck of a man, with his legs together, in a horrible manner; fo that the more he flireth in it, the flraiter it preffeth him; formerly in ufe among the perfecuting papits.

DEVINCTION (Devinciio), in antiquity, was ufed to fignify a love-charm or incantation to gain the affection of a perfon beloved.

It was done by tying knots; and is thus deferibed by Virgil in his eighth Eelogue:

Nege tribus aodis tonses, Amarylli, colores:
Nefe, Avarylli, modu; at Veneris, dil, vinoula nefio.
DEVISE, or Device, in heraldry, painting, and fculpture, any emblem ufed to reprefent a certain family, perfon, action, or quality; with a fuitable motto, applied in a figurative fen'c. See Motto.

The effence of a deviee confits in a metaphorical fimilitude between the things reprefenting and reprefented: thus, a young nobleman, of great courage and ambition, is faid to have borne for his devife, in a late caroufal at the court of France, a rocket mounted in the air, with this motto in Italian, "poco duri $\hat{f} u$ urche m'inalsi;" expreffing, that he preferred a fhort life, provided he might thersby attain to glory and eminence.
The Italians have reduced the making of devifes inso an art, fome of the principal lawe of which are thefe,

1. That there be nothing extravagant or monftous in the figures. 2. 'That theres be never joined which have no relation or alfnity with one another; exeep-

Devife
-
Devotion.
Devotion. ting forme whinfical unions ettablided in ancicnt fables, which cuftom has authorifed. 3. That the human budy be never ufed. 4. The fewer figures the better. 5. The motto hould be every way fuitable.

Devise, in law, the act whereby a pellon bequeatho his lands or tenements to another by his lat will or teftament.

DEUNX, in Roman antiquity, if ounces, or $\frac{18}{\frac{8}{2}}$ of the Libra.

DEVOLVED, fomething acquired by right of devolution. Sueh a right is devolved to the crown: fuch an effate devolval on M —— by the death of N .

The word is alfo ufed for a right, aequired by a fuperior, of conferring a benefice, when the inferior and ordinary collator has neglected to confer, or has conferred it on an unqualified perfon.

If a patron neglects to prefent to a bencfice in fixs months, the prefeutation laples or devolves upon the bithop, from thence to the primate, and from thence to the king.

DEVOLUTION, in lew, a right aequired by fuceeflion from one to another.

DEVONSHEERING, a term ufed by the farmers to exprefs the burning of land by way of manure: the mathod is to cut off the turf about four inches thick, and burn it in heaps, and then fpread the afhes upon the land. The name is probably derived from its having been earlieft practifed in Devoufhire.
DEVONSHIRE, a comity of England, bounded en the fouth by the Englifh channel, on the north by the Brifol channel, on the call by Somerfethire, and on the well by Cornwall. It is about 69 miles lung and 66 broad. The foil is varions; in the wettern pats of the country it is courfe and mooriht, bad for fheep, but proper for black cattle. In the northern parts, the dry foil and downs are well adapted to fheep, with numerous floeks of which they are well covered. Tolerable cr ps of eorn are alfo produced there when the land is well manured. The foil of the rett of the country is rich and fertile both in corn and pafture, yielding alfo in fome places plenty of marle for manuring it. In other places they pare off and burn the furface, making ufe of the afhes as a manure. Dr Campbell fyles it a rich and pleafant comentry; as in different parts it abounds with all forts of grain, produees abundance of fruit, has mines of lead, inon, and filver, in which it formerly exceeded Cornwall, though now it is greatly inferior. On the coat alfo they have herring and pilchard filheries. Devonthire fends two members to parliament, and gives title of Duke to the noble family of Cavendifh.

DEVOTION, DEvotio, a fincere ardent worhip of the Deity.

Devotion, as defined by Juriev, is a foftening and yielding of the heart, with an internal confulation, which the fouls of believers feel in the practiee or exercife of picty By devotion is alfo underitood certain religious practices, whieb a perfon makes it a rule to difcharge regularly; and with reafon, if the exatitude be founded on fulid piety, otherwife it is vanity or fu• pertition,

## $\mathrm{D} \mathrm{E} V \quad[78 \mathrm{r}] \quad \mathrm{D}$ E U

Devorion perfition. That devotion is rain and trifling, which would accommodate itfelf both to God and to the world. Trevoux.

The character of devotion has frequently fuffered from the forbideling air which has been thrown over it, by the narrownefs of bigotry on one hand, or the gloom of fupertition on the other. When freer and more checrin] minds have not lad occation to fee it aconmpanied with thofe feelings of delight and benevolence which naturally attend it, they are apt to be projudiced againtl piety at large, by mitaking this ungracious appearance for its genuine form. Nor has the rant of vulgar enthufiats contributed a little to begret or ftrengthen the fame awerfion, in perfons of a cool and fpeculative temper; who have happened to mect with fuch images and phrates among religionifts of a ceatain itatin, as ill fuit the rational, pure, and firitnal nature of true devotion. It may likewife be remarked on the other fide, that people of talte and fendibility have not feldom been difgulted with the infipid Atyle too often employed on fuch fubjects, by thole who polfefs neither, or who purpolely avoid every thing of that kind, from an ain at limplicity mifunderftood, or perhaps from a fear of heing thought too warm, in an age of fafmonable indifference and falfe iffinement.

Wherever the vital and nnadulterated Spinit of Chrifian devotion prevails, its immediate object will be to pleafe Him whom we were made to pleafe, by adoring his perfections; by admiring his wolks and ways; by entertaining with reverence and complacence the vasious intimations of his pleafure, efpecially thofe contained in holy writ; by acknowledging our abfor lite dependence, and infinite obligations; by confeffing and lamenting the diforders of our nature, and the traufgretions of our lives; by imploring his grace and mercy through Jefus Chrift; by interceding for our brethren of mankind; by praying for the propagation and embellifhment of truth, righteoufnefs, and peace on earth; in fine, by longing for a more entire conformity to the will of God, and broathing after the everlafting enjoyment of his friendhip. The effects of Cuch a Spirit habitually cherifhed, and feelingly expreffed before him, with conceptions more or lefs enlarged and elevated, in language more or lefs emphatical and accurate, fententious or difiufe. muit furely he important and happy. Among thefe effects may be reckoned, a profound humility in the fight of God, $a$ high veneration for his prefence and attributes, an ardent zeal for his worfhip and honour, an affectionate faith in the Saviour of the world, a conftant imitation of his divine example, a diffufive charity for men of all denominations, a generous and unwearied felf-denial for the false of virtue and fociety, a total refignation to Providence, an increafing efteem for the gofpel, with clearer and firmer hopes of that immortal life which it has brought to light.

Devotion, among the Romans, was a kind of facrifice or ceremony, whereby they confecrated themfelves to the fervice of fome perfon. The ancients had a notion, that the life of one might be ranfomed by the death of another; whence thofe devotions became frequent for the lives of the empetors. Devotion to any particular perfon was unknowr among the Romans till the time of Auguftus, The very day after
the title of Augufis had been conferred upen Oeta- Deuternenvius, Pacuvias, a trithure of the people, publiely de- nonita', clared, that he would devote himfelf to Augratus, and Deuterasion obey him at the expence of his life (as was the practice my. among barbarous nations), if he was commanded. I Iis example was immediately followed by all the rell ; tili at lensth it became an eilsblifhed cuilum never to go to falute the emperor, without declaning that they were devoted to him. - Before this, the mate ice of the Romans was that of devoting themfelves to their counuy. See Dectus.

DEUTEROCANONICAL, in the fohool heor. logy, an appellation given to certain books of herly frripture, which were added to the eanon after the reft; either by reafon they were not wrote till after the compilation of the canon, or by reaton of fome difpute as to their canonicity. The word is Greek, being compounded of devet $60^{\circ}$ feconl, and xavovoros cunonical.

The Jews, it is certain, ackuowledged feveral books in their canon, which were put there later than the reft. They fay, that under Efdras, a great aflenbly of their doctors, which they call by way of eminence the great Jynagugue, made the collection of the facred books which we now have in the Hebrew Old Tellament. And they agree that they put books therein. which had not been fo before the Babylonilh captivity ; fuch are thote of Daniel, Ezckiel, Haggai, \&c. and thofe of Efdras and Nehemiah.

And the Romih church has fince added others to. the canon, that were not, nor could not be, in the canon of the Jews; by reafon fome of them were not compofed till after. Such is the book of Ecelcrafticus; with feveral of the apocryphal books, as the Maccabees, Wifdom, \&cs. Others were added fill later, by reafon their canonicity had not been yet examined; and till fuch examen and judgment they might be fet afide at pleafure.-But dince that church has pronounced as to the canonicity of thefe books, there is no more roons now for her members to doubt of them, than there was for the Jews to douht of thofe of the canon of Efdras. And the deuterocanonical books are with them as canonical as the proto-canonical; the only difference between them conlitting in this, that the canonicity of the one was not generally known, examined, and fettled, fo foon as that of the others.

The deuterocanonical books in the modern eanon, are the book of Ether, either the whole, or at leaft the feven latt chapters thereof: the epitle to the Hebrews ; that of James; and that of Jinde; the fecond of St Peter; the fecond and third of St John; and the Revelation. The denterocanonical parts of books, are, in Daniel, the hymn of the three children; the preyer of Azariah; the hiltorics of Sufannah, of Bel and the Dragon ; the latt clapter of St Mark; the bloody fureat, and the appearance of the angel, related in St Luke, chap. xxii; and the hiftory of the adulterous woman in St John, chap. viii.

ISEUTERONOMY, one of the facred books of the Old Teftament ; being the laft of thofe writton by Moles: (Sce Pfntateuch). The word is Greek, compounded of duregos ficond, and invos lawe.

Deuteronomy was written the foth year after the delivery from Egypt, in the country of the Moabites heyond Jordan; Mufes being then in the 120 year

Daran of his age. It contains, in Hebrew, 11 paracises,
N.w. though anly 10 in the edtion of the rabbins at Venice; XX chapters, and 955 verfes. In the Greek, Latin,
and other verlions, it contains XXXIV chapters. The batt is unt of Mules. Some fay it was added by Joflum inmediately after Mofes's death; which is the molt probable opinion. Others will have it added by Efdras.

DEUTEROPOTMT, in Grecian antiquity, a deGgnation given to fuch of the Athenians as had been thought dead, and, after the celebration of the funeral rites, unexpectedly recovered. It was unlawful for the deuteropotmi to enter into the temple of the Eumenides, or to be admitted to the holy rites, till after they were purified, by being lat through the lup of a woman's gown, that they might feem to be new born.

DEUTEEROSIS, the Greek name by which the Jews called their Mifchnah, or fecond law. Sce Misch. NiH.

DEW, a denfe, moit vapour, found on the earth in fpring and fummer mornings, in form of a mitling rain, being collected there chiefly while the fun is below the horizon.

It hath been difputed whether the dew is formed from the vapours afeending from the earth during the night-time, or from the sefcent of fuch as have been already rafed through the day. The moft remarkable experiments adduced in favour of the firt hypothefis are thofe of Mr Dufay of the Royal Academy of Sciences at Paris. He fuppofed, that if the dew afended, it muft wet a body placed low down fooner than one placed in a higher fituation: and, if a number of bodies were placed in this manner, the lowermoll would be wetted firft and the reft in like mamer, gradually up to the top.

To determine this, he placed two ladders againt one another, meeting at their tops, fpreading wide afunder at the bottom, and fo tall as tu reach 32 feet high. To the feveral fteps of thefe he fattened large fquares of glafs like the panes of windows, placing them in fuch a manner that they fhould not overihade one another. On the trial it appeared exactly as Mr Dufay had apprehended. The lower furface of the loweft piece of glafs was firf wetted, then the upper, then the lower furface of the pane next above it ; and fon on, till all the pieces were wetted to the top. Hence it appeared plain to him, that the dew confifted of the vapours afcending from the earth during the nighttime; which, being condenfed by the coldnefs of the atmofphere, are prevented from beitg dilfipated as in the day-time by the fun's heat. He afterwards tried a fimilar expcriment with pieces of cloth inftead of panes of glafs, and the refult was quite conformable to his expectations. He weighed all the pieces of cloth next morning, in order to know what quantity of water each had imbibed, and found thofe that had been placed dowermolt confiderably heavicr than fuch as had been placed at the top; tho' he owns that this experiment did not fucceed fo perfectly as the former.
M. Mufchenbroek, who embraced the contrary opinion, thought he had invalidated all Mr Dufay's proofs, by repeating his experiments, with the fame fuccefs, on a plane covered with fheet-lead. But to this Mr Dufay replied, that there was no occafion for fuppo-
fing the vapour to rife through the lead, nor from that very foot; but that as it arofe from the adjoining open ground, the continual fluctuation of the air could not but fpread it abroad, and carry it thither in its afcent.

But though this experiment of M. Mufchenbroek's is not fufficient to overthrow thofe of Mr Dufay, it mult fill remain dubious whether the dew rifes or falls. One thing which feems to favour the hypothefis of its defeent is, that in clondy weather there is little or no dew to be obferved. From this M. de Luc brings an argument in favour of the hypothefis juit now mentioned. He accounts for it in the following manner. Phit. Trater. When there were no clouds in the air, the heat of the vol. lxiii. inferior air and that which rifes from the earth diffi- patt 2. pates itfelf into the fuperior regions; and then the vapours which are difperfed throughout the air, condenfe, and fall down in dew : But, when the cluods continue, they feparate the inferior from the fuperior part of the atmofphere, and thus prevent the difipation of the heat, by which means the vapours remain fufpended. When the fiy grows cloudy, fome hours after fun-fet, although the heat has been fentibly diminithed, it is again increafed ; becaufe, continuing to rife out of the. earth, it is accumulated in the inferior air. But neither can this be reckoned a pofitive proof of the defeent of the dew ; fince we may as well fuppofe the heat of the atmofphere to be great enough to diffipate it in its afcent, as to keep it fufpended after its afcent through the dily.

On the other hand, its being found in greater quantities on bodies placed low down than on fuch as are high up, is no proof of the afcent of the dew; becaufe the fame thing is obferved of rain. A body placed low down receives more rain than one placed in an elevated fituation; and yet the rain certainly defcends from the atmofphere. The reafon why the dew appears firlt on the lower parts of bodies may be, that, in the evening, the lower part of the atmofphere is firt cooled, and confequently moft difpofed to part with its vapour. It is alfo certain, that part of the water contaned in the air may be condenfed at any time on the fides of a glafs, by means of cold, fo as to run down its lides in fmall drops like dew. It feems, thesefore, that this fubject is not fufficiently determined by fuch experiments as have yet been made; nor indeed does it appear eafy to make fuch experiments as thall be perfectly decilive on the matter.

Several fubitances, expofed to the fame derw, receive and charge themfelves with it in a very diferent manner; fome more, others lefs, and fome even not at all. The dreps feem to make a fort of choice of what hodies they fhall affix themfelvee to: glafs and cryfals are thofe to which they adhere in the moft ready manner, and in the largel quantity; but metals of all kinds never receive them at all, nor do the drops ever adhere to them. The reafon of this is probably becaufe metals promote evaporation more than glafs does. Thus, if a piece of metal and a piece of glafs are both made equally moift, the former will be found to dry in much lefs time than the latter. Hence it would feem, that there is between metals and water fome kind of repulfion: and this may be fufficient to keep off the very fmall quantity that falls in dew; for whatever tends to mate water evaporate after it is actually in contact

## D E IV

Dew. with any fubftance, alfo tends to kecp the water from ever coming into contact with it. On this fubject feveral curious particulars are mentioned by $D_{1}$ Percival, relative to the attraction and repulfion between dew and glafs or metalline veffels. The experiments were made by M. du Fay, who, in order to determine with certainty whether the difference between vitrified fubtances and metals was the fame in all cafes, fei a china faucer in the middle of a filver plate, and on one fide, adjoining to it, was placed a china plate, with a filver dith very much refembling the faucer in the middle. In this experiment the china faucer was covered with dew, but the plate, though extending four inches round it, was not moiltened in the lealt. The china plate alfo had become quite moill, white the filver veffel in the middle had not received the fimallet drop. M. du Fay next endeavoured to afeertain whether a china faucer fet upon a plate of metal, as already defcribed, did not receive more dew than it would have done if expofed alone. To accomplih this delign, he took two watch crytals of equal dimenfions, and placed the one upon a plate of filver, the other upon a plate of china, each with its concavity uppermef. That which was upon the titver plate he furrounded with a fcrrel of the fame metal, well polifhed, that no watery particles inight attach themfelves to the convex furface of the glafs. In this fituation he expofed the cryltals for feveral days fuccetfively, and always found five or fix tines more dew in that which was on the china plate than on the other placed on the filver. The repulion between the dew and filver is further confirmed by the following experiment of M. du Fay, with regard to the cryAtal on the filver plate. He informs us, that the fmall quantity of dew on the infide near the centre, was in minute drops; and that round the border there was a fpace of five or fix lines perfectly dry ; towards which the drops regularly decreafed in magmitude, as if the filver ferrel had driven away the dew from that part of the glats which was contignous to it. 'Theic experiments were repeated thirty times with invariable fuccefo. M. du Fay's experiments have received a remarkable confirmation from tome lately made by Dr Watfon, now bihop of Landaff, with a view to determine the quantity of vapour that afcends from a given furface of carth. "By means of a little beeswax (iafs he), I fatened a half-crown very near, but not quire contiguoas, to the fide of the glafs; and, fetting the glafs with its mouth downward on the grafs, it prefently became covered with vapour, except that part of it which was next the half-crown. Not only the half-crown itfelf was free from vapour, but it had hindered any from fettling on the glafs which was near it ; for there was a litte ring of glais furrounding the half.crown, to the dittance of a quarter of an inch, which was quite dry, as well as that part of the gla!s which was immediately under the hall-crown; it feemed as if the fiver had repelled the water to that diftance. A large red wafer had the fame effcet as the halfcrown; it was neither wetted itfelf, nor was the ring of glafs contiguous to it wetted. A circle of white paper produced the fame effect, fo did feveral other fubitances, which it would be too tedious to enumerate."

Substances of a very different kind from the ufual dew are faid to lave fometimes fallen from the atmorphere, In the Pbil. Tranf, we are told, that in

783 D I W
the year 1 Ég5 there fell in Jreland, in the provances of A3y. Dew I.eintler and Muntler, for a confiderable part of the winter and fpring, a fatty fublance refembling butter, inttead of the common dew. It wat of a clamery texture, and dark yellow colour; and was, from its geteat relemblanee, generally called dizu. buter by the comery people. It always fell in the night, and chictly in the moorith low grounds; and was found langing on the tops of the grafs, and on the thateh of the houfes of the poor people. It was feldom obierved to fall twice in the fame place; and ufually, wherever it fell, it lay a fortnight upon the ground tefore it changed colour; but after that it gradually dried up, and became blach. The cattle fed in the fields where it lay as well as in others, and received no harm by it. It fell in pieces of the bignefs of one's finger-end; but they were diffperfed leatteringly about, and it had an offenfive fmell like a church-yard. There were in the fame places vory tlinking fogs during the winter, and fome people fuppofed this no other than a fediment from the fog. It would not keep very long, but never bred worms.

May-1 m wh $^{*}$ whitens linen and wax ; the dew of am" tumn is converted into a white frolt. Out of dew putrifisd by the fun, arife divers infects, which change apace from onc fpecies into another: what remains is converted into a fine white falr, with angles like thofe of falt-petre, after a number of evaporations, calcinations, and fixations.

There is a fpirit drawn from May-dew, which has wonderful virtues attributed to it. The method of collecting and preparing it, is prefcibed by Hanneman, phylician at Kiel. It is to be gathered in clean linen cloths; expofed to the fun in clofe vials; then diflilled, and the fpirit thrown upon the caput mortuum; this is to be repeated till the earth unite with the fpirit, and become liquid; which happens about the feventh or eighth cohobation or diltillation. By fucle means you gain a very red, odoriferous fpirit. Stolterfolt, a phyfician of Lubec, thinks May-dew may be gathered in glafs-plates, efpecially in till weather ${ }_{p}$ and before fun-rife. And Etmuller is of the fame fentiment. It might likewite be collected with a glafs funnel, expoled to the air, having a.crooked neck to bring the dew irto a vial in a chamber. See Phil. Trani. $n^{\circ}$ 3. Hoffinan, and others. It is apparently from the preparation of this dew, that the brothers of the Rofy-Crofs took their denomination. See Ro. sicrucians.

Derr-Born, in country affairs, a diftemper in cattle, being a fwelling in the body, as much as the kin can hold, fo that tome beatls are in danger of burlling. This diftemper proceeds from the greedinefs of a bealt to feed, when put into a rank pafture: but commonly when the grafs is full of water. In this cafe the bealt fould be ttirred up and down, and made to purge well: but the proper cure is bleeding in the tail; then take a grated nutmeg, with an egg, and breaking the top of the fhell, put out fo much of the white as you may have room to llip the nutmeg into the fhell; mix them together, and then let fhell and all be put down the bealt's throat; that donc, walk him up and down, and he will foon mend.

## Dew-Worm. See Lumbricus.

DE WIT (John), the famous penfionary, was borts in 1625 , at Dort; where he profecuted his fudies fo diligently, that, at the age of 23 , he publifhed Elc

## D E W

ざe Wit.
$\xrightarrow{+}$
menta Curvarun Linearum, one of the deepeft books in mathematies at that time. After taking his degrees, and travelling, he, in 1050, became penfionary of Dort, and diftinguifhed, himfelf very early in the management of publie affairs. He oppofed with all his power the war between the Englifl and the Dutch; and when the event juftified his predictions, he was unanimounly chofen penfionary of Holland. In this capacity he laboured to procure a peace with Cromwell; in which peace a fecret article was introduced by one fide or other, for the exclufion of the houfe of Orange. Ia the war with England after the king's refloration, when it was thought expedient, on Opdam's defeat and death, that fome of their own deputies hould command the flect, he was one of the three put in commiffion; and wrote an aceurate relation of all that happened during the expedition he was engaged in, for which, at his return, he received the fulemn thanks of the States-General. In 1667 , be eftablifhed the perpetual edict for abolihing the office of Stadtholder, to fix the liberty of the republic, as it was hoped, on a firm bafis; which produced feditions and tumults, that reftored the office, on pretence that the De Wits were enemies to the houfe of Orange, and plundered the flate. The pentionary begged difniffion from his poft; which was granted, with thanks for his faithful fervices. But the invalion of the French, and the internal divifions among the. Hollanders themfelves, ipread every where terror and confufion; which the Orange party heightened to ruin the De Wits. Cornelins, the penfonary's brother, was imprifoned and condemned to exile; and a report being raifed that he would be refcued, the mob armed, and furrounded the prifun where the two brothers then were together, dragged them out, barbarouly murdered them, hung the bodies on the gallows, and cut them to pieces, which many of them even broiled, and ate with favage fury. Such was the end of one of the greatef geniufes of his age: of whom Sir William Temple, who was well acquainted with him, writes with the greateft efteem and admiration. He oblerves, that when he was at the head of the government, he differed nothing in his manner of living from an ordinary citizen. His office, for the firt ten years, brought him in little mere than 300 l . and in the latter part of his life, not above 700 l . per annum. He refufed a gifr of 10,000 l. from the States-General, becaufe he thought it a bad precedent in the government. With great reafon, therefore, Sir William Temple, fpeaking of his death, obferves, "He was a perfon that deferved another fate, and a better return from his country; after 18 years fpent in their miniftry, without any care of his entertainments or eafe, and little of his fortune. A man of unwearied induftry, inflexible conftancy, found, elear, and deep underftandiag, and antainted integrity; fo that whenever he was blinded, it was by the paffion he had for that which he eftcemed the good and intereft of his ftate. This teftimuny is jufly due to him from all that were well acquainted with him; and is the more willingly paid, fince there can be as little intereft to flatter, as honour to reproach, the dead."

Befides the works already mentioned, he wrote a book containing thofe maxims of government upon whicl he acted; which will be a never-fading monu$\mathrm{N}^{\circ} 100$.
ment to his immortal memory, A tranflation of it from the original Dutel, intitled, The tro intereft and policial maxims of the republic of Holland, has been printed in London; to the laft edition of which, in ${ }^{\text {. }}$ $16+6$, are prefixed hiftorical memoirs of the illuftrious brothers Cornelius and Join de Witt, by John Campbell, Efq.

DEXTANS, in Roman antiquity, ten ounces, o: $\frac{1}{1} \frac{0}{\xi}$ of their libra. See libra.

DEXTER, in heraldry, an appellation given to whatever belongs to the right fide of a fheld or coat of arms: thus we fay, bend-dexter, doxter point, Sc.

DEXTROCHERE, or Destrochere, in heraldry, is applied to the right arm painted in a flield, fometimes naked; fometimes clothed, or adorned with a bracelet; and fometimes armed, or holding fome moveable or member ufed in the arms.
I)EY, the title of the fovereign of Algiers, under the protection of the grand feignor. A prince under this title was appointed by the fultan, at the requelt of the Turkinn fuldiers, in the year 1710 . The term dey, in the Turkith language, fignities an whte by the mother's fide ; and the reafon of the denemination is this: that the Turkih military confider the grand feignor as their father; the republic as their mother, by which they are nourithed and maintained; and the dey as the brother of the republic, and confequently the anele of all who are ander his dominion. Belides the age, experience, and valour, which are neceffary qualifications of a perfon to be elected, he mull alfo be a native Turk, and have made the voyage to Mecca. He has no guards nor confiderable retinue. He prefides at the divan, and is moft diftinguifhed by the refpect and fubmiffion which are paid him.

DIABETES, in phyfic, an exceflive difcharge of urine, which comes away crude, and exceeds the quantity of liquids drank. Sce (the Index fubjoined to) Medicine.

Diabolus. See Devil.
Diabolus Marinus. See Rala.
Diabolés Mctellorum, a title given by chemifts to jupiter or tin ; becaufe, when incorporated with other metals, it renders them incapable of reduction; or at leaft very difficult to undergo that operation.

DIACAUSTIC curre, a fpecies of the cautic curves formed by refraction.

DIACHYLON, in pharmacy, an emollient digeftive plafter, compofed of mucilages or vifcid juices drawn from cestain plants. See Pharmacy.

DIACODIUM, in pharmacy, a fyrup prepared from poppy-heads. It is allo called the frrupus de meconio. See Pharmacy.

DIACOUSTICS, called aifo piaphonics, the confideration of the properties of refracted found, as it paffes through different mediums: (Sev Acousties.) The word is formed from the Greek siz per, "thro"," which intimates a paffage ; and oxew "I hear," q. d. the confideration of the paflage of the founds we hear. See Sound.

DIACRII, in antiquity, was the name of a party or faction at Athens.- That eity, we read, was divided into two parties: the one favourers of an oligarchy, who would only have a few perfons employed in the government; the other confifted of fuch as were for a democratical or popular government, wherein the whole

## D I A

Diadelphia whole people fhould have a flare. The fird were callIl ed cliacrii, and the latter pectiaci; the latter inhabiting Diagnofis. the lower, and the former the uxpou, or upper quarter or part of the city. - The laws of Solon imported, that Pifiltratus thould be chief of the diacrii; though the fcholiaft on Ariftophanes's comed y The Wafps, affirms, that Pandion ditributed the quarter of the diacrii among lis fons, and put Lycus an their head.

DIADELPHIA (sas "twice," and afintos "a brother"), clafs the 17 th in the fexual fytem, comprehending thofe plants which bear liermaphrodite flowers with two fets of united ftamina; but this circumllance muft not be abfolutely depended on. They are the papilionacei of Toundefort, the irregulares totrapetali of Rivinus, and the leguminofa of Ray. See Botany, the Scheme, P. +30 , and Plate C11. fig. $17^{\circ}$

DIADEM, in antiquity, a head-band or fillet, worn by kings as a badge of their royalty. It was made of filk, thread, or wool, and tied round the temples and forchead, the ends being ticd behind, and let fall on the neck. It was ufually white, and quite plain; tho' fometimes embroilered with gold, and fet with pearls and precions fones. In latter times, it came to be $t$ wifted round crowns, laurels, \&c. and even appears to have been worn on divers parts of the body. See Crown. -The word comes from the Latin diadoma; of the Greek $f^{2} \delta_{n \mu x}$ "a little band encompafing the liead," of the verb $d_{\text {acsew, }}$ cingo, "I gird."

Diadem, in heraldry, is applied to certain circles or rims ferving to inclofe the crowns of fovereign princes, and to bear the globe and crofs, or the flower de luces, for their creft. The crowns of fovereigns are bound, fonme with a greater, and fome with a lefón number of diadems.-The bandage about the heads of Moors on fhields is alfo called diadem, in blazoning.

DIERESIS, in furgery, an operation ferving to divide and feparate the part when the continuity is a hindrance to the cure.

Diferesss, in medicine, is the confuming of the veffels of an animal body, when from fome corroding caufe certain paffages are made, which naturally ought not to have been ; or certain natural paffages are dilated beyond their ordinary dimenfions, fo that the hamours which ought to have been contained in the veffels extravafate or run out.

Difresis, in grammar, the divifion of one fyllable into two, which is ufually noted by two points over a letter, as anlai inttead of aula, diffeliienda for difolretala.

DLETETA, in Grecian antiquity, a kind of judges, of k hicll there were two forts, the cleroti and diallacterii. Thie former were public arbitrators, chofen by lot to determine all caufes excceding ten drachoms, within their own tribe, and from their ientence an appeal lay to the fuperior courts.

The diallacterii, on the contrary, were private arbitrators from whe fe fentence there lay no appeal, and accordingly they always took an oath to adminitter juftice without partiality.

DIACLYPIIlCli, the art of catting or engraving figures on metals, firch as feals, intaglios, matrices of letters, \&ec or coins for medals. See Engraving.

DIAGNOSIS (from darvowra to difccon or difinguifb), the diagnoftics o: the figns of a difafe. They

Vos. V. Part I.
$785]$ D I A
are of two kinds, viz . the adjunct and pathognomonic; Diagnonie the firt are common to feveral difeafes, and ferve only to point out the difference between difeafes of hee fone fpecics; the latter are thofe which ahways attend the difeafe, and dittingnifla it from all others.
D) 1 AGNOST'IC, in modicinc, a form given 10 thofe fygns which indicate the prefent thate of a difeale, its nature and caufe.

DIAGONAL, in geometry, a right line drawn acrofis a quadrilateral figure, from one angle to another; by fome called the diameter, and by others the diumetrol, of the figure. Sce Geometry.
I)IAGORAS, furnamed the Abrift, lised in the 9rf Olympiad. He was not a native of Athens, but he philofophifed there. He delighted in making verfcs, and had compofed a poem which a certain port fole from him. He fued the thief, who fwore it was his own, and got glory by it. This tempted Diagnras to deny a Providence. 'Ihe Athenians fummoncl him to give an account of his doctrise. Ite fled, and they fet a price upon his head, promiling a reward to any who frould kill him; but he took hhipping, and was calt away.

DLAGRAM, in geometry, a feheme for explaining: and demonitrating the properties of any ligure, whethen triangle, fquare, circle, \&c. Sce Geometry.

Diagran, among ancient muficians, the fame with the feale of the moderns. See Seale.

DIAH, Diat, a name given by the Arabs to the punifhment of retaliation. By the Mahometan law, a brother, or the next relation of a murdered perfon, ought to take part againlt the murderer, and demand his blood in reparation for that which he has thed. Before the time of Mahonct, the Arabs had a cultom of putting a freeman of their prifoners to death in lieu of every flave they lott in battle, and a man for every woman that was killed. But Mahomet regulated the laws of reprifal ; directing in the Alcoran, by the diat, that a freeman flould be required for a freeman, and a have for a flave. The Tunks, prebably in confequence of this law, formerly maffacred almolt all their prifoners of war, but they now content themfelves with coflaving and felling them.

DIAEIEXAPLA, or DiAhFXAfte, among farriers, a compound medicine, fo called from its containing fix ingredients, viz. birthwort and gentian roots, juniper-berries, bay-berrics, myrrl, and ivory thavings. It is commended for colds, confumptions, purfincis, and many other diforders in herfes.

DHAL, an intrument ferving to meafure time; which if effected by the aid of the fun, is called a jon dial. The word is from the Idatin dies "day," becaufe indicating the hour of the day. The ancionts alfo called it fituthorium, from its effect by the thadow. See the article Dialing.

DLALECT, an appullation given to the language of a prowince, in fo far as it differs from that of the whole kingdon. The term, however, is more particularly ufed in fpeaking of the ancient Greek, whercof there wore four dialects, the Attic, Ionic, Eolic, and Doric; each of which was a perfect language in its kind, that took place in certain countries, and had peculiar beauties.

Diale cics, lifh and Scotch, almolt every county has a dialect of its
Dialing. own, all differing contiderably in pronunciation, accent, and tone, although one and the fame language.

DIALECTICS, in the literary hithry of the ancients, that branch of logics which taught the rules and modes of reafoning. See Logic, Part III.

Zeno Eleates was the firt who difocered the natural feries of principles and conclufions obferved in reafoning, and formed an att thereof in form or a diaiogue: which, for this reafon, was called dialewica.

The dialectica of the ancients is ufually divided into feveral kinds: the fill was the elaatica, that of Zeno Lieates, which was threefold ; viz. comfentionum, colioquutionum, and contantionum. The firt confiting of rules for deducing or drawing conclufions. The fecond, the art of dialorgue; which became of fuch miniverfal ufe in philofophy, that all reafoning was called interregtect: then, fyllogifm being haid afde, the philofoplates did all by dialogue; it lying on the refpordent to conclude and argue from the feveral conceffions made. The lat part of Zemo's dialectics, Ews me, was contentious, or the an of difputing and contradicting; though fome, paticalany laeriius, afcribe this part to lrotagoras a diciple of Zeno.

The fecond is the chalefica megarica, whofe author is Euelid, no the mathematician, but another of Megara. He gave mack into the method of Zeno and Protagoras: though here are two things appropriatel to him: the firth, that he impagned the demontlations of others, not by affumptions, but conclufinens; continually making illations, and procet ling foom confequace to confequance: the fecond, that he fet alide all argunents drawn from comparifons of fimilitude as invalid.

He was fuceeeded by Lubulides, from whom the fophific way of reafoning is faid to he thrimed. In his time the ant is deforibed as manifond: mentions, failinn, dectra, obvelata, arceralis, cornuta, and calva. Lice Softism.

The third is the dale thics of P'i.to, which he fropofes as a kind of analy is to dircet the human mind, by dividing, dfining, and bringing things to the firt trath; where beioc anived, and itopped there a litele, it ajplise iffelf to explain fertible thinge, but with a
view to return to the firft truth, where alone it can ref. Dialectics Such is the idea of Plato's analyfis.

The fourth is Arifotle's dalectics; containing the doctrine of fimple words, detivered in his bow' of Predicanents ; the doctrine of propofitions, in his book De Anturetatione; and that of the fereral kind; of tytlogiifm, in his books of Analytics, Topics, and Elenchutes.
The sifh is the diak oties of the Stoics; which they cal a part of philofophy, and divide into hhermic and dialectie; to which fome add the definitive, wherobs things are jutly detined; comprehending likutio the canons or critcrions of truth.

The Stuics, before they come to treat of fyllogifins, have two principal places; the one about the fignife:tion of words, the other about the hings lignificd. On occafon of the firlt, they confider abundance of things belonging to the grammarian's province: what, and how many letters; what is a word, dicticn, fpect, \&c. On occafion of the latter, they confider things themedres, ace as withone the mini, but abir it, mceived in it by meaus of the kenfes. Accoraingly, they fith teach, that nil fit in indelleive, quad non torius fhorit in figiv; "whatever is in the mind cane thither by the fiene-s;" and that ari incuffome fiui, as l’ato, who meets the hight; cut fimiandine, as Cxiar hy his eficgy ; aut frfortione, cither by ctinging as a giat or by diminith. ing as a pygmy; cut traylhatione, as a Cydups; aut comprfigiont, as a Contan' ; cut controwio, as a ath ; cu.t priradione, as a blind man.
'The fisth is Eficurus's dialechics; for though he feems to have definfed diaketic, he enlivated it with nesour. He was only averfe to that of the Stoics; who the though attibuted too much to it, as pronoun(ing himane wife who was well verfed in dialectics. For this reatom, liphuma, ferning to fet alide th: comone diakitios, had recourfe to another way; viz. to cation canm, which he foblateated in their fead, the whition whereof he called couonica; and as all quethiow in philoiophy anc cither le wor ore voce, he gave fomate mies fur iach. See Epicureasis.

DIAl.1-1, in anticuity, facrifues performsd by the Atanen dialis. Bue Flaman.
D I A I I N G,

THE art of drawing dials on the furface of any given body or plane. The Grecks and the Latins called this art gromonica and foiallorica, by reafon it diftinguifles the homrs by the fhaduw of the gnomon. Some call it phato fikstertich, becaufe the hours are furetines fnown by the light of the fun. Lattly, others call it horologige $\mathrm{c}_{2}$ ?

Dialing is a moit neceffary art : for notwithfanding we are ptovided with moving machines, fuch as elock; and watches, to flow time ; yet thefe are apt to be out of order, go wrong, and thop: confequently they thand frequently in oeec of rerulation by fome iavariable inArument, as a diat; which being righty contructed and duly placed, will alvays, by motins of the fun, inform us of the the folar time: whirh tume being corrected by the equation table publifad annually in the eqtame-
rides, almanacs, an! o her hooks, will be the mean time to which clocks and watehes are to te fet.

The antiquity of dials is beyond dutbt. Some at-hiatury. tribute their incention io Anaximenes Milefus; and others to Thakes. Vitruius mentions one made by the ancient Chaldec hiflorian Berofus, on a rediang plane, almof parallel to the equinoctial. Aritarchus Samins invented the hemifpherical dial. And there were fome funcical ones, wish a needle for a ghomon. The difcus of Aritarehus was an horizontal dol, with it limb raifed us in around, to prevent the fladows frutching too far.
But it was late ere the Romans became acquanted with dials. The firle fun-dial at Rome was fet up by Fapirius Curfor, about the yar of the city 460 ; befure which time, fays Pliny, there is no mention of ang
account of time but by the fun's rifing and feteing: it was fet up at or near the temple of (liminus, but went ill. About 30 years after, M. Valerius Methala being conful, bronght out of Sicily another dial, which he fit up on a pillar near the rollrum; but for want of its being made for that latitude, it coubll pot gatrue. They mate ufe of it 29 years; till Martius Philippus fet up another more exact.

But there feem to have been dials anong the Jews much earlicr than any of the fe. Witnefs the dial of Ahaz; who began to reign 400 years before Alcxan--der, and within 12 yca:s of the building of Rome; mentioned by Ifaiah, chap. xxxviii. verfe os.

The firt profeffed writer on dialing is Clavius; who demontrates all, both the theory and the operations, after the rigid manner of the ancient mathematicians; but to intricatcly, that few, we dare fay, ever read them all. Dechales and Ozanam give much cafier demonftrations in their Cearfos, and Wolins in his Elcmazes. M. Picard has given a new method of making large dials, ly calculating the homr-lines; and M. de la Hire, in his Dialing, printed in 1683, a grometrical method of drawing hour-tines from certain points determined by obferwation. Eberhardus Welperus, in 1625 , publifhed his Dializig, wherein he lays down a method of drawing the promary dials on a very eafy foundation. The fame foundation is defcribed at length by Sebaftian Munlter, in his Rudimentia Aluthematica, pablifhed in 1551. Sturnius, in 1672 , publifhed a new edition of Welperus's Dialing, with the addition of a whole fecond part, athout inclining and declining dials, de. In $1 ; 08$, the fame work, with Stumius's additions, was republithed with the addition of a fourth part, containing Picard's and de la Hire's methods of drawiag lirge dials. Patcrfon, Michael, and Muller, have tach wrote on dialing, in the German tongue ; Coctfius in Lis Horologiagraphia Ploms, printed in 1689 ; Gauprenius, in his Gnommaica Mtchatian; Bion, in his Uffe of Arotbenatical Inflruncents; the late ingenious Mr Iergufon, in his Sokt Leciares; Mr Einerfom, in his Dialing ; and Mr W. Jones, in his Indrumental Dithing.
A Dial, accurately dffincd, is a plane, upon which lines are deferibed in fuch a manner, that the diadow of a wire, or of the upper edge of another plane, erected perpendicuanly on the former, my fhow the true time of the day.

The edge of the plane by which the time of the day is frund, is called the fite of the dial, which mull be parallel to the earth's axis; and the line on which the fuid plane is erected, is called the fublilio.

The angle included between the fubtile and thile, is called the eleration ur leight of the file.

Thofe dials whofe planes are parallel to the phane of the horizon, are called borizental diuts; and thofe diat, whofe planes are perpendicular to the plane of the horizon, are called articel or ered dials.

Thofe erect dials, whofe planes directly iront the s:orth or funth, are called direta north or fiatb diuls; and all wher crect dials are called decliners, becaufe their planes are tomped away from the north or fouth.

Thufe diads whof planes are neither paralled nor perpendicular to the phane of the horizon, are called in. diuning or rcclining dials, according as their planes make
acute or obtufe angles with the horizon; and if their planes are alfo turned afide from facing the fouth or north, they are called dectinimg-inclining or dectiningmelining dials.
'The interfection of the phane of the dial, with that of the meridian, pafing thromg the hite, is called the meriduan of the dial, or the bour-line of XII.

Thofe meridians, whofe planes pars through the ftite, and make angles of $15,30,45,60,75$, and 90 degrees with the meridian of the place (which marks the hour-line of XII.) are called bour-circtes; and their interfections with the plane of the dial are ealled liour-Fines.

In all declining dials, the fubttile makes an angle with the hour-line of XII.; and this angle is called the difance of the fublitie from the moridian.

The declining ptane's difference of longitude, is the angle formed at the interfection of the itile and plane of the dial, by two meridians; one of which paffen thro' the hour-line of XII. and the othes through the fub. file.

Thus much being premifed concerning dials in general, we fhall now proceed to explain the difierent methods of their contruction.

If the whole carth a $P_{c p}$, were $\operatorname{tran}\left[\right.$ parent, and $P_{3} \cdot c$ hollow, like a fphere of glafs, and had its equator Cl,Vm. divided into 24 equal parts by fo many meridian fig I. femicircles, $a, b, c, d, e, f, g, \& c$ one of which is the Trenivergeographical meridian of any given place, as London fal principle (which is Cuppoled to be at the point $a$;) and if the on which hours of XII were maked at the equator, both upon thatng dethat meridian and the oppufite one, and all the rett of ${ }^{\text {pends. }}$ the hours in order on the reft of the meridians, thofe meridians would be the hour-cireles of London: then, if the fphere had an opaque axis, as $P E P$, terminating in the poles $P$ and $p$, the fhadow of the axis would fall upon every particular meridian and hour, when the fun came to the plane of the oppolite meridian, and would confequently frow the time at London, and at all uther places on the meridian of London.

If this fphere was cut through the middle by a folid Horizontal plane $A B C D$, in the rational horizon of London, one fial. half of the axis $I P$ would be above the plane, and the other half below it ; and is itraight lincs were drawn from the ccritre of the plane to thofe points where its circumference is cut by the hour-circi's of the fphere, thofe lincs would be the hour-hioes of a horizontal dial for London: for the thadow of the axis would fall upon cach paticular hour line of the dial, when it foll upon the like hour-sirde of the fphere.

If the phane which cuts the fphere be upright, as rig. 2. AFGG, touching the given place (Londen) at $F$, and dirctily faciug the meridian of London, it will dien become the plane of an erect direct fouth-dial: and if ight lines be drawn from its centre $E$ to thofe points -ertical of its circumfercace whate the hour-circles of the fphere dial. cut it, thefe will be the hour-lines of a vertical or direet fouth-dial for Londun, to which the hours are to be fet as in the figure (contrary to thofe on a horizontal dial), nud the lower half IP of the axis will cait a hadow on the hour of the day in this dial, at the fame time that it would fall umen the like hurecicle of the fleace, if the dial glane was not in the way.

If the plane (till facing the merivian) be made to $5 \mathrm{G} 2 \quad$ incline,
incline, or recline, any given number of degrees, the hour circles of the fphere will ftill cut the edge of the plane in thofe points to which the hour-lines muft be drawn fraight from the centre; and the axis of the fiphere will cait a thadow on thefe lines at the refpective hours. The like will fill hold, if the plane be made to decline by any given number of degrees from the meridian toward the eath or weft : provided the declination be lefs than 90 degrecs, or the reclination be Belis than the co-latitude of the place: and the axis of the fphere will be a gnomen, or ftile, for the dial. But it cannot be a gnomon, when the declination is quite 90 degrees, nor when the reclination is equal to the co-latitude; becaufe, in thefe two cafes, the axis has no elevation above the plane of the dial.

And thus it appears, that the plane of every dial reprefents the plane of fome great circle upon the earth; and the gnomon of the earth's axis, whether it be a finall wire as in the above figures, or the edge of a thin plate, as in the common horizontal dials.

The whole earth, as to its bulk, is but a point, if compared to its diltance from the fun: and therefore, if a imall Cphere of glafs be placed upon any part of the earth's furface, fo that its axis be parallel to the axis of the earth, and the fphere have fuch lines upon it, and fuch planes within it, as ahove deferibed; it will flow the hours of the day as truly as if it were placed at the earth's centre, and the theil of the earth were as traniparent as glafs.

But becaufe it is impolible to have a hollow fphere of glafs perfectly true, blown round a folid plane; or Wig. 1,2 . if it was, we could not get at the plane within the glafs to fet it in any given polition; we make ufe of a wirefphere to explain the principles of dialing, by joining $2+$ femicireles together at the poles, and putting a thin flat plate of brafs within it.
Draling by A common globe of I2 inches diameter, has genethe con- rally $2+$ meridian fenicireles drawn upon it. If fuch mon terre- a globe be elevated to the latitude of any given place, ffrial globe.and turned about until one of thefe meridians cut the horizon in the north point, where the hour of XII is fuppofed to be marked, the relt of the meridians will cut the horizon at the refpective diftances of all the other hours from XII. Then if thefe points of diftance be marked on the horizon, and the globe be taken out of the horizon, and a flat board or plate be plit into its place, eren with the furface of the horizon; and if jeraight lines be drawn from the centre of the board, to thofe points of dikance on the horizon which were cut by the 24 meridian femicircles; thefe lines will be the hour-lines of a horizontal dial for that latitude, the edge of whofe gnomon mule be in the very fame fituation that the axis of the globe was, before it was taken out of the horizon: that is, the gnom mult make an angle with the plane of the dial, equal to the latitude of the place for which the didel is made.

If the pole of the globe be elevated to the co-latitude of the given place, and any meridian be brought to the north point of the horizon, the reft of the meridians will cut the horizon in the refpective distances of all the hours from XII, for a direct fouth dial, whofe gnomen mult be an angle with the plane of the dial, equal to the co-latitude of the place; and the hours mut be fet the contrary way on this dial to what they are on the horizuntal.

But if your globe have more than 24 meridian femi- Plate circles upon it, you mult take the following method CLVIII. for making borizontal and fouth dials.

Elevate the pole to the latitude of your place, and To conturn the globe until any particular meridian (fuppofe rizuntal a ho the firlt) comes to the north point of the horizon, dial. and the oppofite meridian will cut the horizon in the fouth. Then, fet the hour-index to the uppermort XII on its cirele; which done, turn the globe weltward until 15 degrees of the equator pals under the brafen meridian, and then the hour-index will be at 1 (for the fun moves is degrees every hour), and the fit meridian will eut the horizon in the number of degrees from the north point that I is diftant from X1I. Turn on until other 15 degrees of the equator pafs under the brafen meridian, and the hour-index will then be at II, an't the firt meridian will cut the horizon in the number of dugrees that II is diftant from XII: and fo, by making is degrees of the equator pafs under the brafen meridian for every hour, the firt meridian of the globe will cut the horizon in the diflances of all the hours from XII to VI, which is jult go degrees; and then you need go no farther, for the diftances of XI, X, IX, VIII, V1I, and VI, in the forenoon, are the fame from XII, as the diftances of $1, I I$, III, $1 \mathrm{~V}, \mathrm{~V}$, and VI, in the afternoon: and thefe hour-lines continued through the centre, will give the oppofite hour-lines on the other half of the dial.

Thus, to make a horizontal dial for the latitude of London, which is $51 \frac{1}{2}$ degrees north, elcrate the north pole of the globe $5 \frac{13}{2}$ degrees above the north point of the horizon; and then tura the glabe, until the firt meridian (which is that of London on the Englih terreflrial globe) cuts the north point of the horizon, and fet the hour-index to XII at noon.

Then turning the globe weftward until the indes points fucceflively to I, II, III, IV, V, and VI, in the afternoon, or until $15,30,45,60,75$, and 90 degrees of the equator pafs under the brafen meridian, you will find that the firf meridian of the globe cuts the horizon in the following numbers of degrees from the north towards the eafl, viz. $1 I^{\frac{2}{3}}, 24^{\frac{x}{7}}, 33^{8 \frac{1}{12}}, 53^{\frac{1}{2}}, 7 \frac{1}{1} \frac{1}{15}$, and 90 ; which are the refpective diftanees of the above hours from XII upon the plane of the horizon.

To transfer thefe, and the rell of the hours, to a Fig. jo horizontal plane, draw the parallel right lines $a c$ and $d b$, upon that plane, as far from each odher as is equal to the intended thicknefs of the gnomon or tile of the dial, and the fpace included between them will be the meridian or twelve o'clock line on the dial. Crofs this meridian at right angles with the fix o'cloek line $g h$, and fetting one foot of your compaffes in the interfection $a$, as a centre, defcribe the quadrant $g e$ with any convenient radius or opening of the compaffes: then, fetting one foot in the interfection $b$, as a centre, with the fame radius deferibe the quadrant $f b$, and divide each quadrant into 90 equal parts or degrees, as in the figure.

Becaufe the hour-lines are lefs dittant from each other about noon, than in any other part of the dial, it is befl to have the centres of thefe quadrants at a little diflance from the centre of the dial plane, on the fide oppolite to XII, in order to enlarge the hour-diftances thereabouts, under the fame angles on the plane. Thus,

Yig．s．

## $D$ I A L I N G.

the centre of the plane is at $C$, but the centres of the quadrants are at $a$ and $b$.

Lay a ruler over the point $b$ (and keeping it there for the centre of all the afternoon hours in the quadrant $f b)$ draw the hour-line of I through $11 \frac{2}{3}$ degices in the quadrant; the hour-line of II, through $24 \frac{1}{5}$ degrees; of III, through $38 \frac{7}{\frac{1}{2}}$ degrees; IIII, through $53 \frac{1}{2}$; and V, through $71 \frac{4}{5}$ : and beeaufe the fun rifes about four in the morning, on the longelt days at Iondon, continue tle hour-lines of $1 I I 1$ and V in the aftemoon through the centre $b$ to the oppofite lide of the dial. This done, lay the ruler to the centre a of the quadrant $\epsilon \mathrm{g}$; and through the like divifons or derrees of that quadrant, viz. $11 \frac{2}{3}$. $24^{\frac{7}{4}}, 33^{8} \frac{5}{2}, 53 \frac{8}{2}$, and $71 \frac{1}{3}$, draw the formon hour-lines of XI, X, 1X, VIII, and VIl; and becaufe the fun fets not bufore eight in the evening on the longeit days, continue the hour-lines of VII and VIll in the foremoon, through the centre $a$, to VII and VIII in the aftemoon; and all the hour-lines will be finifhed on this dial; to which the hours may be fet, as in the ligure.

Lattly, through $51 \frac{1}{2}$ degrees of either quadrant, and from its centre, draw the right line of for the hypothenufe or axis of the gromon $a g i$; and from $\delta$, let fall the perpendicular $g i$, upon the meridian line $a i$, and there will be a triangic made, whofe fides are ag, ${ }_{f} i$, and $i a$. If a plate limilar to this triangle be made as thick as the diltance between the lines $a c$ and $b d$, and fei upright between them, touching at $a$ and $b$, its hypothenufe $a g$ will be parallel to the axis of the world, when the dial is truly fet; and will calt a fhadow on the hour of the day.
$N$. B. The trouble of dividing the two quadrants may be faved if you have a fcale with a line of chords upon it (as reprefented on the plate) ; for if you extend the compaffes from o to 60 degrees of the line of chords, and with that extent, as a radius, deferibe the two quadrants upon their refpective centres, the above diftances may be taken with the compaffes upon the the lines, and fet off upon the quadrants.

To make an eriat direat foutb dial. Elevate the pole to the co-latitude of your place, and proceed in all refpects as above taught for the horizontal dial, from VI in the morning to VI in the afternoon; only the hours mult be reverfect, as in the figure; and the hypothenufe a $g$ of the gnomon of $g f$, mult make an angle with the dial-plane equal to the co-latitude of the place. As the fun can fhine no longer on this dial than from lix in the morning until fix in the evening, there is no occafion for having any more than 12 bours upon it.

To make an creal dial, declining from the fouth towards the eafl or wefl. Elevate the pule to the latitude of your place, and ferew the quadrant of altitude to the zenith. Then, if your dial dechnes towards the ealt (which we hall fuppofe it to do at prefent), count in the horizon the degrees of declination, from the eaft point towards the nurth, and bring the lower end of the quadrant to that degree of declination at which the reckoning ends. This done, bring any patticular meridian of your globe (as fuppofe the firf ineridian) directly under the graduated edge of the upper part of the brazen meridian, and fet the hour to XII at noon. Then, ketping the quadrant of altitude at the degree of declination in the horizon, turn the globe caltward
on its axis, and obferve the degrecs cut by the furf Plase meridian in the quadrant of altitude (counted from the CLVII. renith) as the hour-index coms to $X 1, X, 1 X$, \&e. in the forenoon, or as $15,30,45$, Sec. degrecs of the equator pafs under the brazen meridian at thefe hours relpectively; and the degrees then cut in the quadrant by the firit ineridian, are the refpective diltances of the forenoon hours from XII on the plane of the dial. Then, for the afternoon hours, turn the quadrant of altitude round the zenith until it comes to the degece in the horizon oppolite to that where it was placed before; namely, as far from the well point of the horizon towards the fouth, as it was fet at firlt from the eall point towards the north ; and turn the globe weftward on its axis, until the firll meridian comes to the brazen meridian again, and the hour-index to XII: then, continue to turn the globe wellward, and as the index point to the aftemoon hours I, II, III, \&c. or as $15,30,45$, \&e. degrees of the equator pafs under the brazen meridian, the fuft meridian will cut the quadrant of altitude in the refpective number of degrees from the zenith that each of thefe hours is from XIL on the dial.-And note, that when the lirit meridian goes of the quadrant at the horizon in the forenoon, the hour-index flows the time when the fun will come upon this dial ; and when it goes off the quadrant in the afternoon, the index will point to the time when the fun goes off the dial.

Having thus found all the hour-ditances from XII, lay them down upon your dial-plane, either by dividing a femicircle into two quadrants of 00 degrees each (beginning at the lour-line of XII), or by the line of chords, as above directed.
In all declining dials, the line on which the file or gnomon Itands (commonly called the fubpile-lime) makes an angle witls the twelve o'clock liae, and falls amons the forenoon lour-lines, if the dial declines towards the eaft; and among the afternoon iour-lines, when the dial dechincs towards the weit; that is, to the lefthand from the twelve o'cloek line in the former cafe, and to the right hand from it in the latter.

To find the ditance of the fublile from the twelve o'clock line ; if your dial declines from the fouth toward the eatr, count the degrees of that dechination in the harizon from the eall point tervard the north, and hring the lower end of the quadrant of altitude to tlat degree of dechination where the reckoning ends: then, turn the globe until the firt mesidian cuts the horizon in the like number of degrees, counted from the fouth point toward the ealt; and the quadrant and firft mew ridian will then crofs one another at right angles; and the number of degrees of the quadrant, which are intercepted between the firft meridian and the zenith, is equal to the difance of the fubtile line lrom the twelve o'cluck line; and the number of degrees of the fint? meridian, which are intercepted between the quadrans and the north pole, is equal to the clevation of the nith: above the plane of the dial

If the dial dedines weltward from the fouth, come that declination from the calt point of the horizon tu. wards the fouth, and bring the ouadrant of altitule to the degree in the horizon at which the reckoning ends; both for finding the forenoon hours, and ditance of the fubltile from the meridian: and for the afternoon hours, bring the quadrant to the oppofte degree in the horin and then proceed in all refpeets as above.

Thus we have finifhed our declining diel ; and in fo doing, we made four lials, viz.

1. A north dial, declining eaftward by the fame number of degretes. 2. A north dial, declining the fam: number weft. 3. A fouth dial, declining eaft. And, f. A forth dial declining wet. Ontr, placing the proper number of hours, and the tile or gnomon relpectivdy, upon cach plane. For (as ahove mentioned) in the fouth-weft plane, the fubtilar-line falls among the afternoon hours: and in the fontheaft, of the fame declination, amoins the forenoon hours, at equal ditances from X1I. And fo all the moming hours on the weft decliner will be like the aftennoon hours on the eall decliner: the fouth-eat decliner will produce the morth-wen decliner; and the forth-welt decliner the north-eaf decliner, by only extending the hour-lines, fite and fubrile, quite through the centre: the axis of the file (uredge that carts the hadow on the hour of the day) being in all disls whatever parallel to the axis of the world, and confequently pointing towards the north pole of the heaven in north latitudes, and toward the fouth pole in fouth latitudes.

But becaufe every one who would hise to make a dial, may perhaps not be provided with a globe to affit him, and may probably not underfand the metlod of - doing it by logarithmic calculation; we fhall how how to perform it by the plain dialing lines, or feale of latitndes and hours (as reprefented on the Plate), and which may be had on fales commonly fold by the mathematical inftrument makers.

This is the catict of all mechanical methods, and by much the bef, when the lines are truly divided: and not only the half hours and quaters may be laid down by all of them, but every fifth minute hy mont, and cvery fingle minute by thofe where the line of hours is a foot in length.
F:g 5.
Having drawn your double merdian line a $b, c d$, on the plane intended for a horicontal dial, and croffod it at ight angles by the fix o'clock line $j=$ (as in fig. 3.), take the latitude of your flace with the compafies, in the fale of latitudes, and fit that extent from $c$ to $e$, and from $a$ to $f$, on the fis o dock line: then, taking the whole fix liours between the proists of the compafes in the feale of hours, with that extent fet one foot in the point $r$, and let the wher foot fall! where it will upon the meridion line id, as at d. Do the fame from $f$ to $l$, and inaw the wight lincse $d$ and $f^{\prime b}$, each of which will be equal in length to the whole feale of hours. 'Tlus done, fetting one foot of the compaffes in the begimming of the ficale at XH, and extending the other to eweh hom on the feate, lay off thefe extents from d to $e$ for the afternoon homes, and fror. $Z$ to $f$ for thofe of the formom: this will divide the bacs $d_{e}$ and $f$ if in the fame mantor as the houmfoal is divided at $1,2,3,+$ and 6 ; on which the quareors may ahe be had down, if reguited. Then, laying a ruler ou the foint $c$, draw the firn f.e lours in the afternoon. from that point, thameh the Auts at the mun cral foures $1,2,3,4,5$ om the line $d$ e: and
 to the , her fode of the dial, for the like hours of the morni: : which done, lav the riber en the point $a$, and diaw the laft five hows in the furcnoon through the
dests $5,4,3,2,1$, on the line $f b$; continuing the hour- P'se lines of V Il and VII through the centre a to the chvin. other fide uf the dial, for the like hours of the evening; and fot the houss to their refpective lines, as in the ${ }^{\circ}$. gute. Lally, make the gromon the fame way as taught abuve for the horizontal dial, and the whole will le finithed.

To make an ercet fouth-dial, take the co-latitude of your place from the feale of latizudes, and then procced in all refpects for the hour-line as in the lorizontal dial; only reverting the hours, as in fig. 4. and making the angle of the fille's height equal to the co. latitude.

But, left the young dialift fhould have neither globe nor wooden feale, we thall now thow him how he may make a uill without any of thefe helps. Only, if he has not a line of chords, he muit divide a quadrent into 90 equal parts or degrees for taking the proper a gle of the ftile's eleyation; which is eafly done.

With any opening of the compafics, as $Z L$, de- Fig. 6 . foribe the two femicircles $L E k$ and $L \varrho 2$, upon the centucs $Z$ and $\approx$, where the dix o'dock line crofles the don'sl moridian line, and divide each femicircte into I2 equal parts, begiming at $L$ (though, itrictly fpeak- $I_{3}$ ing, only the quadrants from $L$ to the lix o'clock line fiotizontal need be divided) ; then connect the divifons which dial. are equiditant from $L$, by the parallel lines $K M, I N$, $H O, G P$, and $F Q$ Draw $V^{\prime} Z$ for the hyputhenufe of the thle, making the angle $l Z E$ equal to the latitude of your place; and continue the line $V^{r} Z$ to $R$. Draw the line $R$ r parallel to the fix o'cluck line, and fet off the difance $a K$ from $Z$ to $\mathcal{T}$, the diflance $\dot{b} I$ from $Z$ io $I, c I I$ from $Z$ to $W^{r}, d G$ from $Z$ to $T$, and e Ffrom $Z$ to $S$. Then draw the lines $S$ s, $T$, Wra, In, and ry, each parallel to Rr. Set of the ditlance $j$ ? trom a to 1 , and from $j$ to I ; the ditance NX frombto 10 , and from $g$ to 2 ; culV from $c$ to 9 , and from $l$ to $3 ; T$ from $i l$ to 8 , and from $i$ to -4 ; s $\$$ frome to 7 , and fromis to 5 . Then laying a ulur to the centre $Z$, draw the forenoe. hour-lines through the points 11 , $10,9, i=7$; and laying it to the centre $\approx$, hraw the afternoon lines throigh the points 1,2 , 3, 4,5 : consiaving the forenem lines of VII and VII through the centre $Z$, the the oppofite fide of the dial, for the like afternoon hours; and the afternoon lincs IIII and $V$ throngh the centre $\approx$, to the oppofite hale, fir the like morning holus. Set the hours to thefo lines as in the ligure, and then erect the thie or ghmon, and the honeuntal dial will be frombed.

To confund a fonth dri, flaw the line $I^{2} Z$, making an anyle with the meridian $Z L$ equil to the co-latitucie of yourplace: asd procecd in all refpects as in the above leniccutal dial for the fante latimé, reverting the benas as in big. f. and making the eldation of the Enomon cqual to the endatiturie.

Pertaps it nay nut be macceptaile to expiain the method of conlluction the dialing liase, and forae uth-1: whech is as folliows:

 firl into o "and parts, and then each part into 10 ; fo thatl the guadrant be divided into 90 equal parts or

## Pise <br> cl. 1 HI .

degrees. Draw the right line AFB for the chord of this quidrant ; and fetting one foot of the compafle: in the point $A$, extems the other to ile fexara! divifoons of the quadiant, and transler thefe disilims to the lone AF! by the ares $10,10,20,20$, $\begin{gathered}0 \\ \text { and }\end{gathered}$ this whll be the of chords, divided ints $0^{-1}$ madeal parts: which, if tometred foon the line batck affin to the quadrant, will divice it equally. It is phan by the figure, that the ditance foum it to 6s in the line of chords, is jut equal to AE, the vadius of the cirede from wheh that line is made; fur if the are fo, wo be continned, wf which $A$ is the centu, it gocs ex ardy through the conter $E$ of the are 43 .

And therefore, in laying dwwn any number of degrecs on a circle, by the line of chords, yon mott lint open the compantes fo, as to take in juit oo distecs upon that hane, ats from A to 60 : and then, with that extent, as a radias, defolite a circle, which will be exacly of the fam : fise with that fom which the lime was divided: "hich durae, fet one font of the compalfe in the borianing of the chord line, as at $A$, and extend the ather to tive number of degrees you want upon the line; whichextent, aphied to the circle, will inciade the rike number of dates uran it.

Divide the quadrant $6 D$ intu go equal parts and from each poist of divifion draw right lins, $a, i, k .1$. \&ce to the lime $6 F$; all perpendicular to that lime and parallel to $D E$, which will divide $E C$ intu a hate of fines; and althongh thete are feidom put amenis the dialing lines on a feale, yet they affit in dawias the inse of latitudes. For if a ruler be lad upon the pmant 7). ard over each dividon in the line of lines, it will di. vide the quadrant $C B$ into 9 merqual parts, as $B 3$, ,
 drawn along thee enge of the raler. If the tisthe line BC be drawn, fulsending this quabant, and the mat. fil dittances Eid, BL, BC, Eic. be takn on the compaif fes fiom $B$, and fet upon this line in the fome manted as direded for the line of eloords, it will make a lime of latimetes $B C$, equal in leneth to the line of chords Alf. and of an equal number of divinoms, but very unequal as to their lemethes.

Done the right liwe I) GA, fubtending the quathant $D A_{1}$; and parallel to it, draw the bight line ers, tomehing the quadrant $D$. It at a ammeral figure 3. Divide the quadent into fix ermit ? is as 1, 2, 3 , \&c.and through thefe points of diviaun craw righ hanes fiom the e nite $\mathcal{I}^{\prime}$ to the line es, which will divide it at the Irints where the fix hours are to be placed, as in the fguse. If every foxth part of the quadrant be foldulirided into four equal parts, if the line drewn from the centre through the fe peints of divinon, and comtinued tw the line $r$ s, will divice eash hour upon it into guartere.

## Fig 8.

In $\bar{n}$. S. we have the reprefentation of a portable diah, which may be cafly druwn on a cand, and catA,$j$, a ried in a pocket buek. The lines $a d$, $a l$, and $l i c$ of card.
tlread is a fmall plummet $D$. and on the nidide or it Piate a limall bead for thowing the hur of the day. CLVAS.

To rectify this shat, fot the thead in the nit right againt the day of the rooth, and frethe the thead fom the day if the monthene the angelar point where
 piot on the threw, an? the dial will be metited.

Too find sha loour of the day, wite the gomem (no mater how mach or how litic) and low the adge of the dial next the gnomon tumards the fun, fo as the upromot edge of the thadow of the rnomon may
 fir...ly on the face of the dial, by the weiglte ot the flammet, will how the time of the day among the ham-hmes as it i, foremon or afternoon.
'l'o find tuc time of fun-rifing and fetting, move the thuad atmons the hour-lines, until it either covers fome ow of them, or lies fanallel betwixt any two and then it will withe thas a? fan-ilins among the forenoon houn : and of fim foting amony the aftemoon hours, for 2thet du\% of the year io which the theread is ict in the icale of mumths.
'W fod the fin's declination, Atretch the thread from the dey of ham mouth over the angular point at XIf, and it will cht the fun"s dectination, as it is month or Someh, for wat day, in the proper feale.

Th liol un what days the fun enters the figns: when the beot, ds above rectatiod, mowes along any of the curve-lio: which have the lirns of the zodiac marked un whem, the fum enters thofe figns on the dars pointal out by the thread in the foale of montha.

Ihe conftriction of this dial is very eary, efnecially if the reder compares it all mong with lig. 1 . of Phate Clus. as he reads the folluning explanation of that मisure.

Dran the oczult line $A B$ parallel to the top of the Prate card, and erols it at right angles with the fix ochock CLIE
 (́A, deferibe the femicircle AELI, and divie it into 12 equal parts (becinning at $A$ ), as $A$, As, Ese and from theh points of divilien drate the hom lines $r$, $s$, or, ", E, w, and $\because$, all pardlel to the fis: ocluck line E'C'. defcribe the arc $A Z I I$ for the tropic of vo: with the parallel to the faid cdge; move the femicircle in the fame extent, fetting one foot in $G$, defcribe the are $A E O$ for the tropic of $\underline{s}$. Next fetting one foot in the point $h$, and exiending the other to $\tilde{A}$, deferibe the arc $\mathcal{A C I}$ for the beginnings of the figns in and $f$; and with the fame extent, fetting one foot in the point l, defcribe the are $A N$ for the beginnings of the figns $3 I$ and $\Omega$. Set one foot in the point $i$, and having extended the other to $A$, deferibe the are $A K$ for the beginnings of the figns $\mathcal{K}$ and $m$; and with the fame extent, fet one foot in $k$, and defcribe the are $A M$ for the beginnings of the figns $\gamma$ and we. Then fetting one foot in the point $D$, and extending the other to $A$, defcribe the curve $A L$ for the beginnings of $\gamma$ and $\Omega$; and the figns will be finithed. This done, lay a ruler from the point $A$ over the fun's declination in the arch RST'; and where the ruler cuts the line FDG, make marks: and phace the days of the months right againt thefe marks, in the manner hown by fig. 2. Laftiy, draw the thadow-line $P \mathcal{Q}$ parallel to the occult line $A B$; make the gnomon, and fet the hours to their refpective lines, as in fig. 2. and the dial will be thnifhed.

There are feveral kinds of dials called univerfal, becaufe they ferve for all latiudes. One, of Mr lartie's conftruction, was formerly confidered as the bett. It confifts of three principal parts; the firlt whercof is called the horizontal plane $(A)$, becaufe in practice it muft be parallel to the horizon. In this plane is fixed en upright pin, which enters into the edge of the fecond part $B D$, called the meridional plane; which is made of two pieces, the lowelt whereof $(B)$ is called the quadrant, becaufe it contains a quarter of a circle, divided into go degrees; and it is only into this part, near $b$, that the pin enters. The other piece is a femicircle ( $D$ ) adjufted to the quadrant, and turaing in it by a groove, for raifing or deprefling the diameter ( $E F$ ) of the femicircle, which diameter is called the axis of the inffrument. The third piece is a circle $(G)$, divided on both fides into 24 equall parts, which are the hours. This circle is put upon the meridional plane fo, that the axis ( $E F$ ) may be perpendicular to the circle, and the point $C$ be the common centre of the circle, femicircle, and quadrant. The ftraight edge of the femicircle is chamfered on both fides to a flarp edge, which paffes through the centre of the circle. On one fide of the chamfered part, the firt fix months of the year are laid down, according to the fun's declination for their refpective days, and on the other fide the lath fix months. And againtt the days on which the fun enters the figns, there are flraight lines drawn upon the femicircle, with the characters of the figns marked upon them. There is a black line drawn along the middle of the upright edge of the quadrant, over which hangs a thread $(H)$, with its plummit $(I)$, for levelling the inftrument. $N . E$. From the 23 d of Scptember to the 20th of March, the upper furface of the circle mult touch both the ecintre $\mathbb{C}$ 'of the femicircle, and the line of $\gamma$ and $\bumpeq$; and from the 20th of March to the 23d of September, the lower furface of the circle mull touch that centre and line.

To find the time of the day by this dial. Having fet it on a level place in fun-fline, and adjufted it by the levelling ferews $k$ and $/$, until the plumb-line hangs over the back line upon the edge of the quadrant, and N' 100. touches) comes to the latitude of your place in the quadrant: then turn the whole meridional plane $B D$, with its civele $G$, upon the horizontal plane $A$, until the edge of the thadow of the circle falls precifely on the day of the month in the femicircle; and then the meridional plane will be due north and fouth, the axis $E F$ will be parallel to the axis of the world, and will catt a fladow upon the true time of the day among the hours on the circie.
N. $B$. As, when the inftrument is thus rectified, the quadrant and femicircle are in the plane of the meridian, fo the circle is then in the plane of the equinoctial. Therefore, as the fun is above the equinoctial in fummer (in northern latitudes), and below it in winter; the axis of the femicirele will calt a fladow on the hour of the day, on the upper farface of the circie, from the 20th of March till the 23 d of September; and from the 2 j d of September to the zoth of Mareh the hour of the day will be determined by the fladow of the femicincle upon the lower furface of the circle. In the former cafe, the fhadow of the circle falls upon the day of the month, on the lower part of the diameter of the femicircle; and in the latter cafe, on the upper part.

The method of laying down the months and figns Fig. 3 . upon the femicircle is as follows. Draw the right line $A C B$ equal to the diameter of the femicircle $A D B$, and crofs it in the middle at right angles with the line $E C D$, equal in length to $A D P$; then $E C$ will be the radius of the circle $F C G$, which is the fame as that of the femicircle. Upon $E$, as a centre, deferibe the circle $F C G$, on which fet of the ares $C b$ and $C i$, each tqual to $23^{\frac{1}{2}}$ degrees, and divide them accordingly into that number for the fun's declination. Then laying the edge of a ruler over the centre $E$, and alfo over the fun's declination for every fifth day of each month (as in the card-dial), mark the points on the diameter $A B$ of the femicircle from a to $g$, which are cat by the ruler; and there place the days of the months accordingly, anfwering to the fun's declination. This done, fetting one foot of the compaffes in $C$, and extending the other to $a$ or $g$, deforibe the femicircle $a b c d e f g$; which divide into fix cqual parts, and through the points of divifion draw ight lines parallel to $C D$, for the begiuning of the fints (of which one half are on one fride of the femicirele and the other half on the other), and fet the characters of the fines to their proper lines, as in the figare.

Previous to ufe, this infrument fhould be in a welladjuRed

adjuited fate: to perform which, you try the levels of the horizontal plates $A a$, by frft tuening the forews $B B B E$ till the bubbles of air on the ghafs tubes of the fpirit-levels (kevels are at right angles to each other) which are central or in the middle, and remain fo when you turn the upper flate $A$ half round it 3 centre ; but if they fould not keep fin, theere are fnall forews at the end of each level, which admit of being turned one way or the other as may be requifite till they are fo. The plates $A$, buing thus made horizontall, fet the latitude areh or meridian $C$ Iteadily between the two-grooved fides that hold it (one of which is feen at 1 ), by the ferew behind. On this fide 1 ) is divided the nonius or vernier, correfpondiag with the divifions on the latitude arch $C$, and which may be fubdivided into 5 minutes of a degree, and even lels if required. The latitude arch $C$ is to be fo placed in $D$, that the pole it may be in a vertical puition; which is done by making $90^{\circ}$ on the arch at bottom cuincide with the oof the nonius. The arch is then fixed by the tightening ferew at the back of $D$. Hang a filken plumbline on the hook at $G$ : which line is to coincide with a mark at the buttom of the latitude areh at $I$, all the while you move the upper plate $A$ reund its contre. If it does not io, there are four ferews to regulate this adjuftment, two of which pafs though the bale $/$ into the plate $A$ : the other two ferews fafeen the nosius piece $D$ together; which when unferewed a thread or two, the monins piece may be cafily moved to the right or left of 90 as may be found requilite.

I'rob. 1. To frud the lutitude of the place. Falen the latitude and hoor circles together, by placing the pin $K$ into the holes; nide the nomins piece $E$ on the hourcircle to the fun's declination for the given day: the fun's declination yon may know in the eplemeris by White, or other almanacs, fon every day in the year. The nomius picce E mut be fet on that portion of the hour-eircle mateded $N D$ or $S D$, according as the fun has north or fouth declination. About 20 minutes or a quarter of an hour before noon, obferse the fun's fhadow or fpot that paffes through the hole at the axis O, and gently move the latitude arch $C$ down in its groove at $D$ till you obferve the fpot exactly fall on the crofs line on the centre of the nonius piece at $h$; and by the falling of this fpet, fo long as you obferve the fun to incrafe in allitude, you deprefs the areh $C$ : but at the inflant of its flationary appearance the Spot will appear to ro no lower; then fix the arch by the ferew at the lack of $D$, and the degrees thertby cut by the nonins on the arch will be the latitude of the place required: if great cxactuefs is wanted, allow. ance fhould be made for the refraction of the atmof here, taken from fome nautical or atronomical treatife.

Prob.z. The lutitude fithe place hiveg given, to find the time $l y$ the foun or Rers. From an eftremeris as befure, you find the fun's declination for the day north or fouth, and fet the nonius picce $E$ on the arch accordingly. Set the latitude arch $C$, by the nomius at $D$, to the latitude of the place; and place the magnifying glafs at $M T$, by which you will very correstly fet the index canying a nonius to the upper XII at $S$. Tabe out the pin $K$, flacken the horizontal ferew $N$, and gently move, either to the right or left as you fee neceffary, the hour-circle $\Gamma$, at the fame time with the other hand moving the holizutal phate $A$ romad itsais
Vol. V. PatiI.
 into the meridian; which goa will thow by the finn'; fpot falling exactly in the centre of the nomins picee, or where the lines butefect each other. 'The time may be now read of exactly to a minute by the monius on the dial-plate at top, and which will be the time required. The horizontal line dawn on the nonius piece $X$, not feen in the fignire being the parat. lel of declination or path that the fum-dill makes, it therefore can tall on the emire of that line at no other tine but when the latitule arch $C$ is in the meridian or due north and fouth. Hence the bour. circle, on moving round with the pule, mult give the tue time on the dial-plate at top. There is a hole te the right, and crofs hairs to the left, of the centre axis hole 0 , where the fun's rays padies through; whence the fun's thadow or fpot will alfo appear on the right and left of the centre on the nomits piece $f$, the holes of whichare oceafonally ufed as fights to oh. ferve thronglo. If the fun's rags are too weak for a haa dow, a dark glafs to flkeen the cye is occationally placed over the hole. The molt proper time to lind a true meridian is three er foun hours hefore or after noon; and take the difierence of the fun's declinations from noon at the tine you obferse. If it be the moraing, the difference is that and the preceling day; if afternoon, that and the following day: and the meridian being unce found exast, the homr-circle $E$ is in be brought into this meridian, a fixed place made for the dial, and an objeet to obterve by it alfo fixed for it at a great diftance. The lights $L .0$ mull at all times be directed againf this fixed object, to phace the dial truly in the meridian, proper for obferving the planets, monn, or buighttars by night.
Prob. 3. To fund the fun's azimuth and alitude. The latitude-arch $C$ being in the meridian, bring the pole NI into he \%enith, by fetting the latitude-arch to go $0^{\circ}$. Faften the hour-circle $I$ in the meridian, by putting in the pin $K$; fix the horicontal plates by the feren $\mathrm{N}^{\text {; }}$; and fet the index of the diul-plate to X1I. which is the fouth point : Now take out the pin $K$, and genthy move the hour-circle $E$; leaving the latitude arcis fised, till the fun's rays or fpot paffing through the centre-hole in the axis 0 fall on the centre line of the hour-circle $E$, made for that purpofe. The oaimutis in time may be then read off on the dial.plate at top by the magnifying glafs. This time may be converted into degrees, by allowing at the rate of 35 for every bour. By niding the 1.0 nius piece E. fo that the fpot inall fall on the crofs line thereon, the altitude may be taken at the fame time if it dues not exceed 45 legrees. Or the altitude may be taken more univerfaliy, by fixing the nonius piece $E$ to the o on the divifions, and niding down the latitude areh in fuch a manner in the groove at $D$, till the frot Fults exactly on the cenare of the nonias $E$. The degrees and $m_{i}$ nutes then hown by the monias at $D$, taken from go, will be the altitude required. By looking through the fight holes $L, 0$, the altitude of the moon, planets, and ftars, may be cafly taken. Upon this principic it is fomewhat adapted for levelling alfo: by lowering the nonius piece $1 \%$, cqual altitudes of the fun may be lad; and hy railing it higher, equal depreflons.

More cumpletely to anfwer the purpofes of a good thecolulite, of levaling, and the performance of pro5 H
blenis

Clate hems in practical aftronomy, trigonometry, \&c. Mr
W. Jones of Holborn divides the horizontal plate $D$ into $368^{2}$, and an oppofite nonius on the upper plate $A$, fubdividing the degrees into 5 or more minutes. A telefcope and fpirit-level applies on the latitude arch at $H G$ by two fercws, making the latitude arch a vertical arch: and the whole is adapted to triangular ftaffs with parallel plates, fimilar to thofe ufed with the belt

## An equi-

 noctial dial more univerfal.Fig. 2.

A dial more univerfal for the performance of pro. blems than the above, though in fome partienlars not fo convenient and accurate, is made by Mr Jomes and other inftrument-makers in London. It confills of the common equatorial circles reduced to a portable fize, and inftead of a telefiope carrics a plain fight. Its principal parts confift of the fight-piece $O P$, moveable over the declination's femicircle $D$. It has anomines $\mathbb{Q}^{2}$ to the femicircle. A dark glafs to flkreen the eye applies oceafionally over either of the holes at $O$ : thefe holes on the inner fide of the piece are interfected by crofs lines, as feen in the figure be. low; and to the fight $P$ two pieces are ferewed, the lower having a finall hole for the fun's rays or fhadow, and the upper two crols hairs or wires.

The deelination eirele or arch $D$ is divided into two, $90^{\circ}$ each; and is fixed perpendicularly on a circle with a chamfered edge, containing a nonius divifion that fubdivides into friggle minutes the under equatorial circle $M N$, which in all cafes reprefents the equator, and is divided into twice 12 hours, and each hour into five minutes. At right angles below this equatorial eircle is fixed the femicirele of altitude $A B$, divided into two quadrants of $90^{\circ}$ each. This arch ferves principally to meafure angles of altitude and depreffion; and it moves centrally on an upright pillar fixed in the horizontal circle $L F$. This circle $E F$ is divided into four quadrants of $90^{\circ}$ each, and againt it there is fixed a fmall nonius plate at $N$. The horizontal circle may be turned round its centre or axis; and two fpirit levels $L L$ are fixed on it at right angles to one another.

We have not room to detail the great variety of alltronomical and trigonometrical problems that may he folved by this general inftrument, as deferibed in Jones's Infrumentill Dialing. One example connected with our prefent purpofe may lere fuffice, viz. To find the time when the latitucle is given. Suppoling the inftrument to be well adjufted by the directions hereafter given. The meridian of the place fould be firft obtained to place the inttrument in, which is fettled by a diftant mark, or particular cavities to receive the ferews at $I G I$, made in the bufe it lands on. The meridian is beft found by equal altitules of the fun. In order to take thefe, you fet the middle mark of the nonius on the declination arch $D$ at 0 , and fix it by the ferew behind; then fet the horary or hour circle to XII. The cincle EF being next made horizontal, jou dircet the fights to the fun, by moving the horizontal cincle $E F$ and altitude femicircle $A B$ : the degrees and minutes maiked by the no nius on the latter will be the altitude required. 'T'o take cqual altitudes, you obferve the fun's altitude in the morming two or three hours before soun by the femicircle $A B$ : leave the inftrument in the lanc fituation perfucty unaltered till the afternoon, when by moxing the horizontal circle EF, only find the dirction of the feght or the fun's foot to be jult
the fame, which will be an equal altitude with the morning. The place of the horizontal circle EF againt the nonius at each time of obfervation is to be carefully noted; and the middle degree or part between each will be the place where the femicircle $A B$, and fight $O P$, will ftand or coincide with, when directed to the fouth or north, according to the fun's fituation north or fomth at noon at the place of obfervation. Set the index or fight-piece $O P$ very accurately to this middle point, by directing the fight to fome di. ftant object ; or againft it, let one be placed up : this object will be the meridian mark, and will always ferve at any future time. To find the time, the rieidian being thus previondy knewn by equal altitudes of the fun (or flar), and determined by the meritian mark made at a diftance, or by the cavities in the bale to fet the ferew in: Place the equatorial accordingly, and level the horizontal circle $E F$ by the fpinit-Cel's thereon. Sct the femicircle $A B$ to the latitude of the place, and the index of the fights $O P$ to the declination of the fun, found by the ephemeris, as before directed. Tinn the femicircle $D$ till the fight-holes are accurately dirceted to the fun, when the nonius on the hour circle $M N$ will thow the time. It may cafily be known when the fun's rays are direct through, by the fpot falling on the lower interfectors of the marks acrofs the hole at $O$. See the figure $S$ adioining.

The adjuitments of this equatorial dial are to be made from the following trials. $I /$, To adjut the levels LLL on EF: Place the 0 of any of the divifions on EF to the middle mark or fltroke on the nonius at $N$; bring the air-bubbles in the levels in the centres of each cafe, by turning the feveral fcrews at IGFI: this being exatily done, turn the circle $E F$ two $90^{\circ}$ or half round: if the bubble of air then remains in the centre, they are right, and properly ado jutted for ufe; but if they are not, you make them fo by turning the neceffary ferews placed for that purpofe at the ends of the level-cafes by means of a turnicrev, until you bring them to that lixed pofition, that they will return when the plate $E F$ is turned half round. $2 d y$, To adjuit the line of fight $O P$ : Set the nonilis to 0 on the declination arch $D$, the nonius on the hour-circle to V1, and the nomins on the femicircle $A B$ to $0 C$. Direct to fome part of the horizon where there niay be a variety of fixed objects. Level the horizontal circle $E F$ by the levels $L L$, and oblerve any noject that may appea, on the centre of the cros wires. Reverfe the femic ircle $A B$, viz. fo that the oppofite $90^{\circ}$ of it be applied to the nonius, obferving particularly that the other nonii preferve their fituation. If then the remote object formerly viewed Hill continues in the centre of the crofs wires, the line of fight $O P$ is truly adjufled; but if not, unferew the two ferews of the frame carrying the crofs wirec, and move the frame till the interfection appears againt another or new object, which is half way between the firft and that which the wires were againft on the reverfion. Retura the femieircle $A B$ to its former $p o-$ fition: when, if the iaterfection of the wires be found to be againt the half way-object, or that to which they were latt divided, the line of fight is adjuRed; if not, the operation of obferving the interval of the two objeets, and applying half way, muft be repeated.

It is neceflary to obferve, that one of the wires
fould

Plate Mould be in the plane of the declination circle, and CLX. the other wire at right angles; the frame containing the wires is made to hift for that purpofe.

The hole at $P$ which forms the fun's fpot is alfo to be adjufted by directing the fight to the fun, that the centre of the fhadow of the crofs hairs may fall exactly on the upper hole: the lower frame with the hole is then to be moved till the fpat falls cxactly on the lower fight-hole.

Laftly, it is generally neceflary to find the correction always to be applied to the obfervations by the femicircle of altitude $A B$. Set the nonius to 0 on the declination arch $D$, and the nonius to XII on the equator or hour-circle: Turn the fight to any fixed and ditinct object, by moving the arch $A B$ and circle $E F$ only : Note the degree and minute of the angle of altitude or depreffion: Reverfe the dechimation femicircle by placing the nonius on the hour-circle to the oppofite XII: Direct the fight to the fame object again as before. If the altitude or depreffion now given be the fame as was obferved in the former pofition, no correction is wanted; but if not the fame, half the difference of the two angles is the correction to be added to all obfervations or rectifications made with that quadrant by which the kealt angle was taken, or to be fubtracted from all obfervations made with the other quadrant. Thefe feveral adjuftments are abfolutely neceffary previous to the ufe of the inflrument; and when once well done, will keep fo, with care, a confiderahle time.

The Unizerfal or Affronomical Equinoitial Ring-Dial, is an inftrument of an old conftruction, that alfo ferves to find the hour of the day in any latitude of the earth (fee fig. 3.). It confilts of two flat rings or circles, ufually from $f$ to 12 inches diameter, and of a moderate thicknefs; the outward ring $A E$ reprefonting the meridian of the place it is ufed at, contains two divilions of $90^{\circ}$ each oppofite to one another, ferving to let the fliding piece $H$, and ring $G$ (by which the dial is ufually fufpended), be placed on one fide from the equator to the north pole, and on the other fide to the fouth, according to the latitude of the place. 'The inner ring $B$ reprefents the equator, and turns diametrically within the outer by means of two pivots inferted in each end of the ring at the hours XII.

Acrofs the two circles is ferewed to the meridian a thin pierced plate or bridge, with a curfor $C$, that nides along the middle of the bridge : this curfor has a fmall hole for the fun to thine through. The middle of this bridge is conceived as the axis of the worlo, and its extremities as the poles: on the one fide are delineated the 12 ligns of the zodiac, and fometimes oppolite the degrees of the fun's dechination ; and on the orher fide the days of the month throughout the year. On the veher fide of the outcr ring $A$ are the divilions of $g \circ$, or a quadrant of altitude: It ferves, by the placing of a common pin $P$ in the hole $b$ (fee fig. 4.), to take the fun's allitude or height, and from which the latitude of the place may eafily be found.

Ufe of the dial. Place the line $a$ in the middle of the fiding piece $H$ over the degree of latitude of the place. Suppofe, for example, $51^{\frac{1}{2}}$ for London; put the line which croffes the hole of ine curfor $C$ tu the day of the month or the degree of the fign. Open
the inftrument till the two rings be at right angles to each other, and fufpend it by the ring $G$; that the axis of the dial reprefented by the middle of the bridge be parallel to the axis of the earth, viz. the north pole to the north, and rice verfar. 'lhen turn the flat fide of the bridge towards the fun, fo that his rays paffing through the finall hole in the curfor may fall cxactly in a line drawn through the middle of the concave furface of the innar ring or hour-circle, the bright foot by which fows the hou: of the day ia the faid concave furface of the dial. Note, The hour XII cannot. be flown by this dial, becaufe the outer ring being then in the plane of the meridian, exchudes the fuma rays from the inner; nor can this dial fhow the hour when the fun is in the equinoctial, becaufe his raye then falling parallel to the plane of the innce circle ur equinoctial, are cxcluded by it.

To take the altitude of the fuen by this dial, and with the declination therchy to lind the latitude of the place: Place a common pin $p$ in the hole $b$ projecting in the fide of the meridian where the quadrant of alitude is: then hring the centre mark of the fliding picce $H$ to the o or middle of the two divifions of latitude or the other fide, and turn the pin towards the fun till it cuts a thadow uver the degree of the quadrant of altitude ; then what degree the fhadow cuts is the altitude. Thus, in fig. 4. the fladow bs appears to cut $35^{\circ}$, the altitude of the fun.

The fun's declination is found by moving the curfor in the fliding picee till the mark aerofs the hole fand. juft againfl the day of the month; then, by turning to the other fide of the bridge, the mark will ftand againft the fun's declination.

In order to find the latitude of the place, observe that the latitude and dechimation be the fame, vir. both north or fouth; fubtract the declination from the meridian or greatelt daily altitude of the fun, and the romainder is the complement of the latitude; which fubtracted from $90^{\circ}$, leaves the latitudc: Example :
The meridian altitude may be The fun's declination for the day

## Complement of latitude

The latitude

| Deg. min. |  |
| :---: | :---: |
| 57 | 48 |
| 19 | 18 |
| 38 | 30 |
| 90 | 0 |
| 51 | 30 |

But if the latitude and declination be contrary, add them together, and the fum is the complement of the latitude. This dial is fometimes mounted on a ftand, with a compafs, two fpirit-levels, and ad. jutting ferews, \&c. Ezc. (fee fig. 5.), by which it is rendered more ufful and convenicnt for hinding the fun's azinuth, altitudes, variation of the needle, dechinations of planes, Sic. Acc.

An Univerfal Diad on a plain crofs, is deforibed by univertat Mr Fergufon. It is moveable on a joint $C$, for elde crumedab
 as it Rands upon the horizontal board $A$. The amm of the erofs fland at right angles to the middle part : and the top of it, from $a$ to $n$, is of cqual length with cither of the arms $n e$ or $m$. Sue hire 6.

This dial is restified by feting the midule line $t: a$ to
the latitude of the place on the quadrant, the board $A$ level, and the point $N$ northward by the acedle; thus, the plane of the crofs will be parallel to the plane of the equator. 'Then, frem III o'clock in the morning till Vf , the upper edge $k l$ of the arm io wifl eat a fhadow on the time of the day on the file of the ann $c m$; from VI till IX, the lower edge ; of the arm io will catt a hadow on the hours on the file oq. From IX in the morning to XII at noon, the edge ab of the top part an will call a hadow on the hours on the arm nef; from XII to III in the afternoon, the edge $c$ d of the top part will catt a hadaro on the hours on the arm $/ / m$; from III to VI in the evening, the edge $g$ b will cat a fhatow on the hours on the part $p q$; and from VI till IX, the fhadow of the edge of will thow the time on the top part an. The breadth of each part, ab, ef, sce mut be fo great, as rever to let the hadow fall quite without the part or arm on which the honrs are manked, when the fun is at his greatef declination from the equator.

To determine the breadh of the fides of the arms which contain the hours, fo as to be in juft propurtion to their lengtla ; make an angle $A B C$ (fig. 7.) of $2 \mathrm{~g}^{\frac{1}{2}}$ degrees, which is equal to the fun's greatut dechituation ; and fuppofe the length of each arm, from the fide of the long midule part, and alfo the length of the top part above the arms, to be equal to $B C$. Then, as the edges of the fladow, from each of the arms, will be parallel to $B e$, making an anzle of $23 \frac{1}{2}$ degrees with the fide $B d$ of the am, when the fun's declination is $23 \frac{10}{2}^{\circ}$; it is plain, that if the leagth of the arm be $B d$, the leaft breadth that it ean have, to kep the edge $B e$ of the fhadow $B \operatorname{eg} d$ from going off the fide of the arm $d e$ before it comes to the end of it ed, mult be equal to $e d$ or $d B$. But in order to keep the thadow within the quarter divifions of the hours, when it comes near the end of the arm, the breadth of it hould be ftill greater, fo as to be almont doubled, on account of the ditance between the tips of the arms.

The hours may be placed on the arms, by laying lown the erofs abed (ig. 8.) on a theet of paper; and with a black-lead peneil held clofe to it, drawing its fhape and fize on the paper. Then take the leagth $a c$ in the compafles, and with one fuot in the conner a, defcribe with the other the quadrant ef. Divide this are into fix equal parts, and through the puints of divifion draw light lines ag, $a \%$, \&c. continuing three of them to the arm ce, which are all that ean fall upon it ; and they will meet the arm in thofe points through which the lines that divide the hours from each other, as in fig. 6. are to be drawn right acrofs it. Divide each arm, for the three hours contained in it, in the fame manner; and fet the hours to their proper places, on the fides of the arms, as they are marked in fig. 33. Each of the hour fpaces hoold be divided into four equal pats, for the half hours and quarters, in the quadrant $e f$; and right lines fhould be drawn through thefe divifion-marks in the quadrant, to the arms of the crofs, in order to determine the places thereon where the fubdivifions of the hours mult be marked.

This is a very fimple kind of univerfal dial; it is eafly made and has a pretty, uncommon appearatuce in a garde.

Fig. 9. is ealled a Lniaural Mictanical Dial, as by its equinocitial circle an eafy metiod is had of defuribing a dial on any kind of plane. For exPlate
CLX, ample: Suppofe a dial is required on an horizontal Eafy mocplane. If the plane be immoveable, as $A B C D$, find trawing a a meridian line as GF; or if moveable, aflume the me- daal by the ridian at pleafure: then by means of the triangle univeffat ERF, whofe bafe is applicd on the meridian line, neal dat. rate the equino eial dial $I /$ thll the index $G I$ becones Fis $\%$. parallel to the ax is of the carth, (which is fo, if the angle $K 2 F$ be equal to the elevation of the pole), and. the $t=$ o'elock !ine on the dial hag oner the meridian line of the plane or the bafe of the trimgle. If then, in the nipht-time or a darkened face, a lighted candle be fuccefively applied to the axis GI, lo as the fladow of the index or fyyle (al fall unon one hour-line after another, the fame fladow will mans ont the feveral hour-lines on the plate $A B C D$. Noting the panits therefore on the fhadow, draw hinos through them to $G$; then an index being fized on $G$, accoodiug to the angle $I G F$, its thadow will point out the feveral hours by the light of the fun. If a dial were required on a vertical plane, having raifed the equinoctial cincle as directed, puth forward the index $G /$ itl the tip thereof $I$ tencla the plane. If the plane be inclined to the horizon, the elevation of the pole fhoculd be found on the fame; and the angle of the triange $K E F$ bould be made equal thareto.

Mr Eergufon defrities a mealhod of making three Dials on ${ }^{23}$ dials on thice difficrat plesues, fo that they may all jbow thentree planes time of the day ly one gnomon. On the flat board $A B C$ by one grue deferibe an horizomal dial, with is gnomon $F G H$, mon. the edge of the fladow of which flows the time of ${ }^{\text {Fig. }} \mathbf{x o}$. the day. To this horizontal buard join the upright board EDC, tonching the cdge GH of the gumon; then making the top of the gnomen at $G$ the eentre of the vertical fauth dial, defuribe it on the board $E D C$. Befides, on a circular plate $1 K$ defribe an equinoctial dial, and, by a lit $c d$ in the XII o'clock line from the edge to the centre, put it on the gnomon $E G$ as far as the flit will admit. The fame gnomon will fhow the fame hour on each of thefe dials.

An Univerfal Dial, forwing the bours of the day by a terivgrial slobe, and by the findilous of fereral gnomons, at the fame time: together wuith all the places of the earth whith are then enlightened by the fan; cmal thoge to which the fun is then rifors, or on the nueridian, or felting. This dial is made of a thick fquare picce of wood, or hollow metal. The fides are cut into femicirenlar hollows, in which the hours are placed; the lile of es h hollow coning ont from the brttom thereof, as far as the ends of the kollows pioject. The corners are cat out into angles, in the infides of which the hours are alfo marked; and the edge of the end of each fide of the angle ferves as a tite for calling a fhadow on the hours marked on the other fide.

In the middle of the uppermoit fide, or plane, there is an equinoctial dial : in the contre whereof an upright wire is fistd, for cafting a thatow on the hours of that dial, and fupporting a mall terreltrial globe on itstop.

The whole dial fands on a pillar, in the middle of a round horizontal board, in which there is a compafs and magnctic needle, for placing the meridian thik to-

Plate
ClIX.

Fig 10.
ward the fouth. The pillar has a joint with a quadrant upon it, divided into go davrees (fupporiell to be hid from fight under the dial in the figure) for fettigg it to the latitude of any given place.

The equator of the glowe is divided into $2+$ equal parts, and the hoursare laid down unom it at thele parts. The time of the day may bs known by thefe hours, when the fun fines upon the globe.
'Fo reatify and ufe this dial, Fet it on a level takle, or Sule of a window, where the fun thines, placing the meridian file due fouth, by means of the needle; which will be, when the nedle points as far from the nurth fiem-de-lis towatd the well, as it decinces weltwand, at your place. 'Then bend ale pillur in the joine, till the back line on the pillar conses to the latitude of your phace in the quadrant.

The machine being thes rectined, the plane of its did part will be paralled to the cupator, the wirc or anis that fuppors the glute will be parallel to the earth's auis, and the north pole of the gle be will point toward the north pole of the heavens.
The fane hone will then be hown in feveral of the boliows, hy the ends of the fhaciows of their relpective tiles: the axis of the globe will cait a chadow on the Gume bom of the day, in the equimetial dial, in the centre of which it is placed, from the 20th of March to the 23 d of September; and, if the meridian of your place on the globe be fet even with the meridian itile, all the parts of the globe that the fun fhines upon, will anfwer to thofe places of the real earth which are then enlightened by the fun. The places where the thade is juit coming upon the globe, anfwer to all thofe places of the earth to which the fen is then fetting; as the places where it is going off, and the light coming on, anfuer to all the piaces of the earth where the fin is then riling. And lafty, if the hour of VI be marked on the equator in the meridian of your place (as it is marked on the merritian of London in the figure) the divgon of the light and thate on the globe will thow the time of the day.
The northern alile of the dial (oppofite to the fouthern or muridian one) is hid from the fight in the Egure, by the axis of the globe. The hours in the kollow to which that ftile belongs, are alfo fuppofed to be lide by the oblique yjew of the figure: but they are the fame as the haurs in the front-liohow. The fe alio in the righet and left laud femicircular hollows are molly hid from fight; and foallo are all thofe on the fides next the cye of the four acute angles.

The conitruction of thic dial is as follows :
Fig. 9.
On a thick fquare prece of wood, o metal, draw the lines $a c$ and $b d$, as far from cach other as you intend for the thicknefs of the Rile abod; and in the fame manner, draw the like thicknefs of the other theee thiles, $\in f g b, i l / m$, and $n \circ p q$, ali flanding outright as from the centre.

With any convenient opening of the compaffes, as a $A$, (fo as toleave proper fitrength of onfif when $K^{\prime} I$ is ecrual to $a A$ ), fet onc foct in $a$, as a centre, and with the other figt defcribe the quadrautel are $A c$. Then, without altering the compalies, fet one foot in $l$ as a conter, and with the cther foot deferibe the quadrant $\{E$. All the other quadrants in the figure inull be decribed ic the farme ranner, and with the fane open-
ing of the compafis, on their centres of $i k$ and $n 0$ and each cyadrat dividel imo fix equil parts, for as many hours, as in the figure; emen wion parts mutt be fubdivided into t, tor the hall-hours and quarters.

At equal dillances from each corner, draw th. right lines $I p$ and $K p, L, q$ and $A q$, Nr and $O r, I$ and
 NrO, and $P s e^{2}$; making the ditanem between the tips of the helluws, as $/ K, L, N, N O$, and $D \because$, cach equal to the radins of the quadrants; and leaving
 for the equinoctial in the midele.

To divide the infides of thete angles properly for the hour-fpaces thercom, take the following rathoud.

Sict one foot of the compaties in the point $l$ as a centre, and open the other to $K^{\circ}$; and with that opeaing deferibe the are $K^{\prime} t:$ then, withont aitering the compafies, fet one foon in $h^{\prime}$, and with the other foot deferibe the are It. Divide cash of thefe ates, from $I$ and $K^{\prime}$ to their interfection at $t$, into four cqual parts; and from their centres $/$ and $K$, through the primts of divition, draw the right lines $/ 3,1+1,15,16,17$; and $K^{\prime}, K_{1}, K^{\prime} 12, K 11$; and they will met the fides $K \rho$ and $I f$ of the angle $I 力 K$ where the hours thereon muft be placed. And thefe hour-Spaces in the arcs mult be fubdived into four equal parts, for the half hours and quaters.--Do the like for the ochicr three angles, and draw the dotted lines, angl fet the hours in the intides where thofe lines nuept them, as in the figure: and the like hour-lines will be parallel to each other in all the yuadrants and in all the angles.
Mark points for all thefe hours on the upper lide: and cut out all the angular hollows, and the quadrantal ones quite through the places where thar four gnomons muit ftand ; and lay down the hous on their inftes, (as in fig. 10.), and fet in their gnomons, which mult be as broad as the diall is thick; and this breadth and thicknefs mat be large enough to keep the fhadows of the gnomons from ever fulling quite out at the fides of the hollows, cven when the lun's declimation is at the greatelt.
Lally, draw the equinoctial dial in the millle, all the hours of which are equidithat from cach other; and the dial will be fimilicd.

As the fungoes round, the bioad end of the hadow of the tile acb $b$ will thow the houss in the quadant she, from fun-rife till i 1 in the morning; the hade is from the cad $M$ will how the hours on the file l. 4 from $V$ to ly in the moming; the dhadow of the teike of $g b$ in the quadrant $O_{5}$ (ian the long deri) with thow the hours from fundre" till VI in the nombrat and the thadow of the end $N$ will how the moraing hours, on the fide O $r$, fiom 115 to VII.
Jut as the haduw of the nombern Mite abod goes off the quadrant $A$, the thadus of the fouthern lite $i=1 \mathrm{~m}$ begins to fall :whin the quadram Fl , at VI in the monnerg; and fhows the time, in that quadrant, from Vitill $\lambda I l$ at an an and from noon till $W$ in the evening in the quadmant $m$ E. And the hadow of the end $O$ flows the the from XI in the ferenoon till 11 I in the afternon, on the fise $A N$; as the fladow of the end $P^{\prime}$ thans the time. noon, on the fide 2 s.

At noon, when the fhadow of the eaftern tile ef $\dot{g} b$ goes of the quadrant $b C$ (in which it fhowed the time from VI in the morning till noon, as it did in the quadant $g$ from fun-rife till VI in the morning), the fhadow of the weitern file $n o p q$ begins to enter the quadrant $H p$; and hrows the hours thereon from XII at noon till VI in the evening; and after that till funfet, in the quadrant $q G$ : and the end 2 cafts a fladow on the fide $P s$ from $V$ in the evening till IX at night, if the fun $b \mathrm{c}$ not fet before that time.

The fhadow of the end $I$ hows the time on the fide Kp from III till VIl in the afternoon; and the fhadow of the file abod hows the time from VI in the evening iill the fun fets.

The fhadow of the upright central wire, that fupports the globe at top, mows the time of the day, in the iniddle or equinoctial dial, all the fummer half-year, when the fun is on the north fide of the equator.

Having fhown how to make fun-dials by the affittance of a good globe, or of a dialing fcale, we thall now proceed to the method of conftructing dials arithmetically; which will be more agretable to thofe who lave le:rned the elements of trigonometry, becaufe qlobes and fcales can never be fo accurate as the logarithms in finding the angular diftances of the hours. Yet as a globe may be found exact enough for fome other requilites in dialing, we thall take it in occafionally.

The contruction of fur-dials on all planes whatever may be included in one general rule: inteiligible, if that of a horizontal-dial for any given latitude be well underfood. For there is no plane, however obliquely fituated with refpect to any given place, but what is parallel to the horizon of fome other place; and therefore if we can find that other place by a problem on the terrettrial globe, or by a trigonometrical calculation, and confruct a horizontal dial for it ; that dial applied to the plane where it is to ferve will be a true dial for that place.-.Thuz, an erect direct fouth dial in 5 I $\frac{1}{2}$ degrees north latitude, would be a horizontal-dial on the lame meridian, 90 degrees fouthward of $51 \frac{1}{2}$ degrees north latitude: which falls in with $38 \frac{1}{2}$ degrees of fouth latitude. But if the upright plane declines from facing the fouth at the given place, it would fill be a horizontal plane go degrees from that place, but for a different longitude, whicle would alter the reckoning of the hours accordingly.

Case I. 1. Let us fuppofe that an upright plane at London declines $3^{6}$ degrees weftward from facing the fouth, and that it is required to find a place on the globe to whole horizon the faid plane is parallel ; and alfo the difference of longitude between London and that place.

Rectify the glube to the latitude of London, and buing london to the zenith under the brafs meridian; then that point of the globe which lies in the horizon at the given degree of declination (comated weftward from the fouth puint of the horizon) is the place at which the :bovementiuned plane would be horizontal. - Now, to find the latiende and longitude of that place, keep your eve upon the place, and turn the globe eaftwad until it comes under the graduated edge of the;
brafs meridian ; then the degree of the brafs meridian that flands directly over the place is its latitude; and the number of degrees in the equator, which are intercepted between the meridian of London and the brafs meridian, is the place's differencc of longitude.

Thus, as the latitude of London is $51 \frac{1}{2}$ degrees north, and the declination of the place is 36 degrees weft; elevate the north pole $51 \frac{1}{2}$ degrecs above the horizon, and turn the globe uatil London comes to the zenith, or under the graduated edge of the meridian ; then count 36 degrees on the horizon weftward from the fonth point, and make a mark on that place of the globe over which the reckoning ends, and bringing the mark under the graduated edge of the brafs neridian, it will be found to be under $30 \frac{5}{5}$ degrees in fouth latitude: keeping it there, count in the equator the number of degrees between the meriuian of London and the brafen meridian (which now becomes the meridian of the required place), and you will find it to be $+2 \frac{1}{4}$. Therefore an upright plane at London, declining 36 degrees weftward from the fouth, would be a hoizontal plane at that place, whofe latitude is $30 \frac{1}{7}$ degrees fouth of the equator, and longitude $42 \frac{2}{2}$ degrees welt of the meridian of London.

W'hich difference of longitude being converted into time, is 2 hours 51 minutes.

The rertical-dial declining weltward 36 degrees at London, is therefore to be drawn in all refpects as a horizontal-dial for fouth latitude 305 degrees; fave only that the reckoning of the hours is to anticipate the reckoning on the horizontal-dial by 2 hours 51 mi nutes: for fo much fooner will the fun come to the meridian of London, than to the meridian of any place whofe longitude is $t^{2} 3$ degrees welt from London.
2. But to be more exact than the globe will fhow us, we hall ufe a little trigonometry.

Let NESW be the horizon of London, whofe zenith is $Z$, and $P$ the north pole of the fphere; and let $Z$, bie the pofition of a vertical plane at $Z$, declining wetward from $S$ (the fouth) by an angle of 36 degrees; on which plane an erect-dial for London at $Z$ is to be defcribed. Make the femidiameter $Z D$ perpendicular to $Z b$; and it will cut the horizon in $D$, 36 degrees well of the fouth $S$. Then a plane, in the tangent $H D$, touching the iphere in $D$, will be parallel to the plane $2 b$; and the axis of the fphere will be equally inclined to both thefe planes.

Let $W$ 是 $E$ be the equinoctial, whofe elevation above the horizon of $Z$ (London) is $38 \frac{1}{2}$ degrees; and $P R D$ be the nerridian of the place $D$, cutting the equinoctial in $R$. Then it is evident, that the arc $R D$ is the latude of the place $D$ (where the plane $Z B$ would be horizontal) and the arc $R$. Q is the difference of longitude $^{\text {a }}$ of the planes $Z$ b and DH.

In the fpherical triangle $W D R$, the arc $W D$ is given, for it is the complement of the plane's declination from $S$ to forth; which complement is $54^{\circ}$ (viz. $90^{\circ}-36:$ ) the angle at $R$, in which the meridian of the place $D$ cuts the cquator, is a right angle; and the angle RWD meafures the elevation of the equinoctial alrove thie horibon of $Z$, namely $38 \frac{1}{2}$ degrees. Say therefore, As radius is to the co-fine of the plane's declination from the fouth, fo is the co-fine of the latitude of $Z$ to the fine of $R D$ the latitude of $D$ : which is of a different demonination

Plate CLIX.

Plate denomination from the latitude of $Z$, becaufe $Z$ and CLIX. $D$ are on different fides of the equator.

As radius - - - 10.00000
To co-line $36^{\circ} 0^{\prime}=R$ Q 9.90796
So co-fine $51^{\circ} 30^{\prime}=22.9 .79+15$
To fine $30^{\circ}{ }_{14}=D R(9.70211)=$ the lat. of $D$, whofe horizon is parallel to the vertical plane $Z b$ at $Z$.
$N . B$. When radius is made the firft term, it may be omitted; and then by fubtracting it mentally from the fum of the other two, the operation will be fhortened. Thus, in the prefent cafe,
To the logarithmic line of $H^{\prime} R={ }^{*} 54^{\circ} 0^{\circ} 9.90796$
Add the logarithmic fine of $R D=\uparrow 3^{8 \prime} 30^{\prime} 9.79415$
Their fum-radius - - - - - 9.70211 gives the fame folution as above. And we flall keep to this method in the following part of this article.
T'o find the difference of longitude of the places D and $Z$, fay, As radius is to the co-fint of $3 \frac{5}{\frac{r}{2}}$ degrees, the height of the equinoctial at $Z$, fo is the co-tangent of 36 degrees, the plane's declination, to the co-tangent of the difference of longitudes. Thus,

To the logarithmic fine of $\ddagger 51^{\circ} 30^{\prime} \quad 9.89354$
Add the logarithmic tang. of $\$ 54^{\circ} 0^{\prime}$
Their fum-radins - - - - - 10.03228 is the nearelt tangent of $77^{\circ} 8^{\prime}=W R$; which is the co-tangent of $4 \cdot 2^{5} 52^{\prime}=R .2$, the difference of longitude fought. Which difference, being reduced to time, is 2 hours $5 \frac{1}{2}$ minutes.
3. Aud thus having found the exact latitude and longitude of the place $D$, to whofe herizon the vertical plane at $Z$ is paralled, we thall proceed to the conftruction of a horizontal dial for the place $D$, whofe latitude is $30^{\circ} 14^{\prime}$ fouth; but anticipating the time at $D$ by 2 hours 51 minutcs (neglecting the $\frac{x^{2}}{2} \min$. in practice), becaufe $D$ is fo far well ward in longit ude from the meridian of Lomelon; and this will be a true vertical dial at London, declining wettward $3^{6}$ degrees.
Fig. S.
Affume any right line CSL for the fubtile of the dial, and make the angle $K C P$ equal to the latitude of the place (uiz. $30^{\circ}{ }^{1}+^{\prime}$ ), to whole honizon the plane of the dial is parallel ; then CRP will be the axis of the flile, or edge that cafts the fladuw on the hours of the day, in the dial. This done, draw the contingent line EQ, cutting the fubftiar line at right angles in $K$; and from $K$ make $K R$ perpendicular to the axis $C R P$. Then $K G(=K R)$ being made adius, that is, equal to the chord of $60^{\circ}$ or tangent of $45^{\circ}$ an a good fector, take $42^{\circ} 52^{\prime}$ (the difference of longitude of the places $Z$ and $D$ ) from the tangents, and having fet it from $K$ to $M$, draw $C M$ for the lour-line of XII. T'ake $K N$, equal to the tangent of an angle lefs by 15 degrees than $K M I$; that is, the tangent of $27^{\circ} 52$ : and through the point $N$ draw $C N$ for the hour-line of I. The tangent of $12^{\circ} 5^{\circ}$ (which is $15^{\circ}$ lefs than $27^{\circ} 42^{\prime}$ ), fet off the fame way, will give a point between $K$ and $N$, through which the hour-line of II is to be diawn. The tangent of $2^{2} 8$ (the differmee between $45^{\circ}$ and $52^{\circ} 52^{\prime}$ ) placed on the othcr fide of $C L$, will deternine the point through which
the hour-line of III is to be drawn: to which $2^{\circ} 8^{\prime \prime}$, if the tangent of 15 be added, it will make $17^{\circ} 8^{\prime}$; and this fet off from $K$ towards $\mathcal{Q}$ on the line $E Q$, will give the point for the hour-line of IV : and fo of the reft. - The forenom hour-lines are drawn the fane way, by the continual addition of the tancents $15^{\circ}$, $30^{\circ}, 45^{\prime}$, Se. to $42^{2} 52^{\prime \prime}\left(=\right.$ the tangent of $\left.K M^{\prime}\right)$ for the lours of XI, $\mathrm{X}, \mathrm{I}$, \& Ec . as far as weceffary; that is, until there be five hours on each lide of the fubtile. The fixth hour, aceounted from that hour or part of the hour on which the fubblile falls, will be always in a line perpendicular to the fubtile, and drawn through the centre $\mathcal{C}$.
4. In all erect dials, CM, the hour-line of XII, is perpendicular to the horizon of the place for which the dial is to ferve; for that line is the interfection of a vertical plane with the plane of the meridian of the place, both which are perpendicular to the plune of the horizon: and any line $H O$, or $b o$, perpendicular to $6: A T$, will be a horizontal line on the plane of the dial, along which line the hours may be nunbered; and $C M$ being fet perpendicular to the horizon, the dial will have its true polition.
5. If the plane of the dial had declined by an equal angle toward the eaf, its defeription would have differed only in this, that the hour-line of XII would have fallen on the other fide of the fubtile CL, and the line HO would have a fubcontrary pofition to what it has in this figure.
6. And thefe two dials, with the upper points of their files turned toward the north pole, will furve for other two planes parallel to them; the one declining from the north toward the edit, and the other from the north toward the welt, by the fame quantity of angle. The like holds true of all dials in general, whatever be their declination and obliquity of their planes to the horizoll.

Case II. 7. If the plane of the dial not only declines, but allo reclines, or inclines. Suppofe its declination from fronting the fouth $S$ be equal to the arc $S D$ on the horizon; and its reclination be equal to the are $D$ d of the vertical circle $D Z$ : then it is plain, that if the quadrant of altitude $Z d D$ on the globe cuts the point D) in the horizon, and the reclination is comated upon the quadrant from $D$ to $d$; the interfection of the hour circle $P R d$, with the equinoctial $W$ 是 $E$, will determine $R d$, the latitude of the place $d$, whofe horizon is paralle to the siven plane $Z b$ at $Z$ : and $R .(2$ will be the difference in longitude of the places at $\sqrt[d]{ }$ and $Z$.

Trigonometrically thus: Let a great circle pais thro' the three points, $W, d, E$; and in the triangle $W / D / d$, right-angled at $D$, the fides $W D$ and $D d$ are given ; and thence the angle DW'd is found, and fo is the hypothenufe W'd. Again, the difference, or the fum, of $D \|^{\prime} d$ and $b l V R$, the clevation of the equinoctial above the horizon of $Z$, gives the angle dWR; and the hypothenufe of the triangle $W R i I^{\text {w }}$ was jut now found; whanee the fides $R d$ and $W R$ are found, the furmer heing the latitude of the place $d$, and the latter the complement of $R$ 吕, the difference of longitude fought.

Fig 6.

* The co-fine of 36.0 , or of $R \mathscr{Q}+$ The co-fine of 51.30 , or of $2 Z$. $\ddagger$ The co-fine of 38.30 , or of IVDR. of The co-tangent of 35.5 , or of $D W$.
"rins, if the datatad of the place 2 be $52^{3}$ ior anth; the declination $\mathcal{S} D$ of the plane 解 (which would he lorizontal at $d$ ) be $3^{6^{\circ}}$, and the reclimation be $15^{\circ}$, or equal to the are I)d; the fouth latitude of the placed, that is, the are $R 6$ !, will be $15^{\circ}{ }^{\prime} \xi^{\prime}$; and $R \mathcal{P}$, the difference of the longitude, $3^{6} 2^{\prime}$. From thefe data, therefore, ict the dial (fig. 7.) be defcribed, as in the former esample.

8. There are feveral other thinss requifite in the mantice of dialing; the chitf of which thall be given in the form of arithmetical rules, fimpic and cafy to there who have learned the elements of trigonometry. For in pracieal arts of this Sind, arivhmetic fould be whed as far as it can go; and feales never trufted to, except in the final contruction, where they are abfolutely neceflary in laying cown the calcalated hour-diflances on the plane of the dial.

Rule I. To find the erngles retioh the lenor-lines on any diel moke with the frabioc. "To the logarithmic fine of the given latitude, or of the flile's tevation above the plane of the dial, add the logarithmic tancent of the hour (") diftance from the meridian, or from the ( $t$ ) fubfile ; and the fum mimis radius will be the logarithmic tangent of the angle fought.

For $K_{C} C$ is to $K$ 身 in the ratio componmed of the ratio of $\bar{K} C$ to $K G(=\overline{A R})$ and of $A G$ to $K M$; which making $C \bar{K}$ the radius 10,000000 , or 10,0000 , or 10 , or $t$, are the ratio of 10,002000 , or of 10,0000 , or of 10 , or of I , to $\hat{K} G \times \bar{K} \mathrm{~K} \%$.

Thus, in a horizontal diah, for latitude $5^{5} 30^{\prime}$, to find the angular diftance of XI in the forenoon, or I in the afternoon, from XII.

To the logarithmic fine of $51030^{\prime} \quad 9.99354!$
Add the logarithmic tany. of $5100 \quad 9 \cdot+2805$
The fum-radius is
9.32159 = the Iorgrithmictangent of $11^{\circ} 50^{\circ}$, or of the angle which the hour-line of XI or I makes with the hour of XII.

And by computing in this manner, with the fine of ihe latitude, and the tangents of $30,45,60$, and $75^{\circ}$, Fur the hours of IT, III, MMI, and V in the afterncon: or of $\mathrm{X}, \mathrm{IX}$, VIII, and V II in the foremoon; you will find their angular difances from XII to be $27^{\circ} \mathbf{1 8}^{\prime}$, 3 3 $3,53^{3} 35$, and $7: 6$; which are all that there is occation to compute for.- And the fe diffances may be fet off from XII by a line of chords; or rather, by taking tooo from a fale of equal parts, and letting that ertent as at :adius from $C$ to XII; and then, taking zog of the iame parts (which are the natural tangent of $11^{\circ} 50$ ), and fetting them from XII 10 XI and I, on the line l:o, which is perpendicular to $C$ XII : and fo for the rett of the homr-lines, which in the table of natural tangents, aqainf the above sifo tances, are $451,-82,1355$ and 2020 , of fuch equal part. from XII, as the rathes C SII contains 1000 . No 100.

And. lafly, fet off 125 ( (the matural angent of $5 \mathrm{t}^{\circ}$ $30^{\circ}$ ) for the angle of the thile's leight, which is equal to the latitude of the piace.

Rule II. The laitude of the place, the jurs's dectination, and Lis bour eliflunce frum the moridhan, being givin, to fiai (1) bie altudi, (2.) Lis azinuth. (1.) Let $d$ be the Cus': place, $d R$ his declinaton; and, in the triangle $P Z d, P d$ the fum, or the difierence, of $d R$, and the quadrant $P R$, being given by the fuppolition, as alfo the complement of the latitude $P Z$, and the angle $A P Z$, which meafures the horary diflance of $d$ from the meridian ; we flall (by Cafe 4 . of Keill's oblique fineric 'lrigonometry) find the bafe Z', which is the fun's ditance from the zenith, or the complement of his atitude.

And (z.) as fine $Z l l$ : ine $I_{d}!:$ fine $d P Z: d Z P$, or of it fupplement $D Z S$, the azimuthal ditance from the fouth.

Or the practical rule may be as follor:s.
Write $A$ for the fign of the fun's altitude, $I$, and $l$ for the fine and co-ine of the latitude, $D$ and $d$ for the fine and co-fine of ine fun's declination, and $H$ for the line of the horary difance from VI.

Then the relation of $f^{r}$ lo $A$ will have three varieties.

1. When the declination is toward the elevated pole, and the hour of the day is hetween XII and VI; it is $A=L D+H \prime d$, and $H=\frac{A-L D}{l l}$
2. When the hour is after VI, it is $A=L D$ - Ifli, and $H=\frac{I \cdot D+A}{1 d}$
3. When the declination is toward the deprefted pole, we have $A=H H-L D$, and $H=\frac{A+I I)}{1!}$

Which theorems will be found uliful, and expeditious enough for folving thofe problems in geography and dialing which depend on the retation of the fun's altitude to the hour of the dar.

Esample I. Suppofe the latitude of the piace to be 5! : degrees north: the time five hours diftant from Fif, that is, an hour after VI in the moming, or before $\mathrm{V}^{+} \mathrm{I}$ in the evening; and the fun's declination $20^{\circ}$ north. Required the finn's altitude?
'Then to log. $L=\log . \operatorname{fn} .51^{\circ} 30^{\prime} \quad 1.8935 t^{*} *$

$$
\text { add } \log \cdot D=\log \cdot \sqrt{1 n} \cdot 20^{\circ} \quad 0^{\prime} \quad \text { I. } 53+05
$$

Their fum $1 .+2759$ give
$L D=$ logarithm of $0.26-66$, in the natural fines.
And, io log. $H=\log$. Fin. $+1.15^{\circ} 0^{\prime} 1.4^{1} 300$
add $\left\{\begin{array}{lll}\log , ~ & i=\log \cdot \mathrm{fin} .7+33^{\circ} 0 & 1.79+14\end{array}\right.$ $\left\{\log . d=\log \cdot \ln 1870^{\circ} O^{\prime} 1.97300\right.$

Their fum r.180I + gives
Mit=logarithm of $0.15 \mathrm{I}+08$, in the natural fines.
And
(*) 'Ihat is, of $15,30,45,50,750$, for the hours of I, II, IIT, MIT, V, in the afternoon; and XI, X, IX, vlll, VIl, in the aftemon.
$(t)$ In all horizontal dids, and er, $\boldsymbol{t}$ north or fouth dials, the fubsile and meridian are the fame: but in all declining dials, the fublile line inakes an angle with the menidian.
( $\ddagger$ ) $\ln$ which cafe, the radius $C K$ is fuppofed to be divided into 10,0000 egual parts.
. Here we confider the rallus as unity, and not 10,00000 ; by which, inflead of the index 9 , we lave - -1 as above: which is of wo father ufe than making the work a little eafier.
tt The diltance of one hour from VI.
SThe co-declination of the Sun.

Piate And thele two numbers ( 0.26766 and 0.151408 ) CLIX. make 0.41 ge7 $=A$; which, in the thle, is the nearefo natural fine of $24^{\circ} 47^{\prime}$, the fun's altitude fought.

The fame hour-diftance being aftumed on the other Gide of VI, then $L D$-Fild is O.Is 6256 , the fine of $6^{\circ} 40^{\frac{r}{2}}$; which is the fun's altitude at V in the moming, or VIl in the evening, when his north decination is $20^{\circ}$.

But when the declination is $20^{\circ}$ fouth (or towards the depreffed pole) the difference FIld $-L D$ becomes regative; and thereby hows, that an hour before VI in the morning, or patt V I in the evening, the fun's centre is $6^{\circ} 40 \frac{1}{2}^{\prime}$ below the horizon.

Enamp. 2. From the fame duta, to find the fion's $a \approx i-$ muth. If $H, L$, and $D$, are given, then (by par. 2. of Rule II.) from $H$ having found the iltitude amt its complement $Z d$ : and the are $I d$ (the diftance from the pole) being given; fay, As the co-fine of the altitude is to the fine of the diftance fiom the pole, fo is the fine of the hour-diftance from the meridian to the fine of the azimuth diftance from the meridian.

Let the latitude be $51^{\circ} 30^{\prime}$ north, the declination $15^{\circ} 9^{\prime}$ fouth, and the time II h. 24 m . in the afternoon, when the fun begins to ilhminate a vertical wall, and it is required to find the polition of the wall.

Then, by the foregoing theorems, the complement of the altitude will be $81^{\circ} 32^{\frac{1}{2}}$, and $P d$ the ditance from the pole being $\log ^{\circ} 5$, and the horary ditance from the meridian, or the angle $d P Z, 36^{\circ}$.

「o logr fin. $74^{\circ} 51^{\prime}$
$1.9^{8}+64$
Add log. fin. $36^{\circ} 0^{\prime}$
1.76922

When the altitude is given, find from thence the hour, and proceed as above.

This praxis is of lingular ufe on many occafons; in finding the declination of vertical planes more exactly; than in the common way, cfpecially if the tranfits of the fun's centre a:e-obferred by applying a ruler with fights, either plain or telefcopieal, to the wall or plane whofe declination is required. In drawing a moridian line, and findiny the magnetic variation. In fiuding the bearings of places in terreftrial furveys; the tranfits of the fun ove: any place, or his horizontal difance from it, being oofer ved, together with the altitude and hour. And thence determining fmall differences of longitudt. In obferving the variations at fea, \&e.
'lhe declination, inclination, and reclination, of planes, are frequently taken with a fufficient degree of ace uracy by an inftrument called a declinator or declinatog.

The conftruction of this inftrument, as fomewhat improved by Mr Jonce, is as follows: On a maho gany board $A R I K$, is inferted a femicircular arch $A G E R$ af ivory or bos-wood, divided into two quadrants of $90^{\circ}$ each, beginning from the middle $G$. On the centre $C$ turns a vertical quadrant 1 IFE, livided intu $9^{0}$, begiming from the bafe $E$; on which is a moveatlle index $C F$, with a fmall hole at $F$ for the fun's rays to pafs thro', and form a foot on a

Vol. V. l'art II.
mark at $C$. The lower extremity of the quabant at $E$ is printed, to nark the lamar dincetion of the quadrant when applical to any other funce on his quadrant takes off oceafomathe and at plamblin: $p$ hanss at the centre on di. fer thine the inclian. tions and reclinations of phane. At $J_{7}$, on the flane of the board, is inferted at compale of points and degrees, with a maynctical neculc turniar on a pivit over it. The addition of the morcalle quathan al index confilerably extem the utility of the declina. tor, by rendering it conveniemt for takiar estal alio turles of the fun, the fun's altitude, and latimg, at the fame time, \&e.

To apply this informent in takirg the declintion Totake hay of a wall or plata: Place the dide dell in an larian- ir the a' tal direction to the plane propafed, and offerve what reanand degree or point of the compats the $N$ pant of the cin? a mie neerlle fands ove from the north or the fouth, and it rulian ha: will be the difination wf the plane from the nomh or fouth accordingly. In this cafe, allowance muth ise: made for the rariation of the necolle (if ans) at the: place: and which, if not previoully known, will rader this operation very inaccenate: At Iomdon it is now $22^{\circ} 30^{\prime}$ to the well.

Another way more exak may ie wed, when the fun fhines out lalf an hour before noon. The lide ACB Being plareri agand the plane, the chabluat mat be fo moved on the fomicircte $A(B l$, and the ind". $C W$ on $D E$, till the furs rays paling thoungh the hole at $F$ fall exactly on the mank at $G$, and cortinued fo till the fun requires the index to be wifal no higher : you will then lave the meridian or greatell atituck of the fun; and the angle contantacd be1 ween $G$ and $E$ will be the dectination requivel. The pofition of CES is the meridian or $1=0^{\text {chedock }}$ line. But the mont exact way for taking the dectipation of a plane, or finding a meridian lise, by this inftrument, is, in the forenoon, about two of thee hours before 12 o'clock, to otferve two or thec heights or altitudes EF of the fun; and at the fane time the refpective angular polar ditances $G E$ from ( $\mathcal{E}$ : wite them down ; and in the afternoon wath for the fame, or one of the fame altitudes, and mark the ingular diftances or diftance on the quadrant $A G: N o w$, the diviton ar degree exactly bureen ilic tun noted angular ditances will be the true merician, and the diflance at which it may fall from the $C$ of the divifoons at $G$ will be the declination of the plane. The reafon for obferving two or three altitudes and angles in the morning is, that in cafe thete thould be clourls in the afternoon, you may have the chance of one correfponding altitude.

The quadrant oceafionally tates off at $C$, in orbler to place it on the furface ol a pecettal or plame interol. ed for an horizontal dial; and thereby from cqual altitudes of the fun, as abowe, draw a nucridian or 12 octock line to fet the dial by.

The bafe $A B I K$ forves to take the inclination and reclination of planes. In this calf, the quadrant is taken off, end the plummet $P$ is fitted on a pin at the centic $C$ : then the fide $/ G K$ being appliti to the plane propofed, as 9. ( fig. 7.) of the plumb-line cuts the femicirele in the point $(b$, the phane is hucizonta? ; or if it cut the quadrant in ans point at $S$, then will $G C S$ be tho angle of inclination. Ladly, if applying 51
the
the fade $A C B$ (rig 7.) to the plane, the plunmet cuts $G$. the plane is vertical; or if it cuts pither of the quadrants, it is accondingly the angle of reclination. Fsuce, if the quantity of the angle of inclination be eonoared with the elevation of the pole and equator, it is eafly known whether the plane be inchined or reclined.

## Of the double Horizonta! Dial, and the Babylonian ar.:Italian Dials.

To the gnomonic projection, there is fometimes added a fiereggraftie projection of the hour-circles, and the parallils of the fun's declination, on the fame horizoutal plane; the upright fide of the gnomon being flopedinto an edge, ftanding perpendicularly over the eentre of the projection : fo that the dial, being in its due polition, the thadow of that perpendicular edge is a vertical circle pafing though the fun, in the flereographic projection.

The months being duly marked on this dial, the fun's declination, and the length of the day at any time, are had by infpection (as alfo his altitude, hy means of a fcale of tangents). But its chief property is, that it may be placed ture, whenever the fun thines, without the help of any other inflrument.
Fig. 6.
Let $d$ be the fun's place in the ftereograplnic projicetion, $x d y$ a the paralich of the fun's declination, $Z d$ a verticle circle through the fun's centre, $P d$ the hourcircle ; and it is evident, that the diameter NS of this projection being placed duly north and fouth, thefe three circles will pars through the point $d$. And therefore, to give the dial its due pofition, we have only to turn its gnomon toward the fun, on a horizontal Plane, until the hour on the common gromonic projeetion coincides with that marked by the hour-circle $\beta d$, which paffes through the interfiction of the thaduw $2 d$ with the circle of the fun's prefent declination.

The Babylonian and Italian dials reckon the hours, not from the meridian as with us, but from the fun's rifing and fetting. Thus, in Italy, an hour before fun-fet is reckored the 23 d hour; two hours before fun-fet the 22 d hour; and fo of the reft. And the Gladow that marks them on the hour-lines, is that of the point of a ftile. This occations a perpetual variation between their dials and clocks, which they mult corect from time to time, before it arifes to any fenfible quantity. hy fetting their clocks fo much fafter or nower. And in Italy, they begin their day, and regulate their clocks, not from fun-fet, but from about mid-wilight, when the Gue-Mharia is faid; which corrects the difference that would otherwife be between the clock and the dial.

The impreverients which have been made in all forts of inftruments and machines for meafuring time, have rendered frch dials of little accomnt. Yet, as the theory of them is ingenious, and they are really, in fome refpects, the belt contrised of any for vulgar ufe, a general idea of their defcription may not be unacceptable.
7ig. 8.
is perpendicular to $C R$ ) the radius of the equinoctial AEQ, and draw RS perpendicular to CK for the lite of the dial ; the fhadow of whofe point $R$ is to mark the hours, when $S R$ is fet upright on the plane of the dial.

Then it is evident, that, in the contingent line $\mathcal{A} \mathcal{Q}$, the ipaces $\mathrm{K}_{1}, \mathrm{~K}_{2}, \mathrm{~K}_{3}$. \&cc. being taken equal to the tangents of the lowr-ditamees from the meridian, to the radius KG, one, two, three, \&c. hours after fun rifing, on the equinoctial day; the fladow of the point $R$ will be found, at thefe times, refpectively in the points $1,2,3, \& \mathrm{c}$.

Dlaw, fur the like hours after fun-rifing, when the fun is in the tropic of Caprieon is $I^{\text {r }}$, the like common lines CD, $C E, C F, \& \mathrm{c}$. and at thefe hours the fhatow of the point $R$ will be found in thofe lines refpectively. Find the fun's altitudes abore the plane of the dial at thefe hours; and with their co-tangents $S d, S e, S f$, Sc. to radius $S R$, defcribe arcs interfecting the hour-lines is the points $d, e, f$; \&c. fo thall the right lines $1 d, 2 e, 3 f, \& \mathrm{c}$. be the lines of I, II, III, \&c. hours after fun-rifing.

The conitruction is the fane in every other cafe; due regard being had to the difference of longitude of the place at which the dial would be horizontal, and the place for which it is to ferve: and likewife, taking care to draw no lines but what are neceffary; which may be done partly by the rules already given for determining the time that tlie fun thines on any plane; and partly from this, that oa the tiopical days, the liyperbola defcrited by the hadow of the point $R$ limits the extent of all the hour-lines.
Of the rigbt placing of Dials, and having a true Meridian Line jor the regulating of Clocks and Watches.
The piane on which the dial is to retl being duly prepared, and every thing neceflary for fixing it, you nay find the hoar tolerably exact by a large equinoctial ring-dial, and fet your watch to it. And then the dial may be fixed by the watch at your leifure.

If you would be more exact, take the fun's altitude by a good quadrant, noting the precife time of obfervation by a clock or watch. Then compute the time for the altitude obferved; and fet the watch to agree with that time, according to the fun. A Hadley's quadrant is very convenient for this purpofe: for by it you may take the angle between the fun and his image refected from a bafon of water; the half of which angle, fubtracting the refraction, is the altitude required. This is belt done in fummer; and the nearer the fun is to the prime vertical (the ealt or weft azimuth) when the obfervation is made, fo much the better.

Or, in fummer, take two equal altitudes of the fun in the, fame day; one any time between 7 and so in the morning, the other between 2 and 5 in the afternoon ; noting the momerts of thefe two obfervations by a clock or watch: and if the watch fhows the obfervations to be at equal diftances from noon, it agrees exastly with the fun: if not, the watch mult be corrected by half the difference of the forenoos and afternoen intervals; and then the dial may be fet true by the watch.

Thus, for example, fuppofe you had taken the fun's altitude when it was 20 minutes pat VIII in the morn-

Plate
ClXt.
ing by the watch; and found, ty obferving in the afternoon, that the fun had the fane altitude 10 monutes before IIIT; then it is plain, that the watel was 5 mimutes too falt for the fun: for 5 minutes after XII is the middle time between VIII h. 20 m . in the morning, and IIIh. 50 m . in the afternoon; and therefore to make the watch agree with the fun, it mult be fet 26 back five minutes.
A neridian A goodmeridian line for regnlating clocks or watchlime. es, may be had by the following method.

Make a roumd hole, almoft a quarter of an inch diameter, in a thin plate of metal; and fix the plate in the top of a fouth window, in fuch a manner, that it may recline from the zenith at an angle equal to the co-latitude of your place, as nearly as you can guefs: for then the plate will face the fun dinectly at noon on the equinoctial days. I et the fun thine fieely thro' the hole into the soom; and hang a plumb-line to the cciling of the room, at leall five or fix feet from the window, in fuch a place as that the fun's rays, tranfmitted through the bole, may fall upon the line when it is noon by the cluck; and laving marked the faid place on the ceiling, take away the line.

Having adjuited a fliding bar to a dove-tail groove, in a piece of wood about 18 inches long, and fixed a hook into the midale of the bar, nail the wood to the above-mentioned place on the ceiling, parallel to the fide of the room in which the window is; the groove and bar being towards the flour: Then hang the plumb-line upon the hook in the bar, the weight or plummet reaching almoft to the floor; and the whole will be prepared for farther and proper adjultment.

This done, find the true folar time by either of the two lalt methods, and thereby reguate your clock. Then, at the moment of next noon by the clock, when the fun flines, move the fliding-bar in the groove, until the fhadow of the plumb-line bifcets the image of the fun (made by his rays tranfinitted thro' the hole) on the floor, wall, or on a white fereen placed on the north-fide of the line; the plummet or weight at the end of the line hanging freely in a pail of water placed below it on the floor.-But becaufe this may not be quite correct for the firt time, on account that the plummet will not fettle immediately, even in water; it may be farther corrected on the following days, by the ahove method, with the fun and clock; and fo brought to a very great exactnefs.
$N . B$. The rays tranfmitted through the hole will calt but a faint image of the fun, even on a white fereen, unlefs the room be fo darkened that no funShine may be allowed to enter but what comes thro, the fmall hole in the plate. And always, for fome time before the obfervation is made, the plummet ought to be immerfed in a jar of water, whele it may hang freely; by which means the line will foon become iteady, which otherwife would be apt to continue fwinging.

## Defcription of tavo New Influments for facilitating the sraitice of Dialing.

I. The Dialing Secfor, contrived by the late Mr Benjamin Martin, is an inftument by which dials are drawn in a more eafy, expeditious, and accurate manner. It is reprefented on the plate as now made by Mr

Jones of Holborn. The princtpal lines on is are the line of lutitudes and the line eff bours. 'Illey are found on molt of the common plane ticales and fectors; but in a manner that greatly confines and diminifhes their ufe: for, lint, they are of a fanel hergh; and, fecondly, toe fortll for any degree of accurac). Dut in this new fector, the line of latitules is hid down, as it is called, fectorzuife, viz. one line of latitudes upon each leg of the lector, beginning in the centre of the joint, and diverging to the end (as upon other fecturs), where the extremes of the two lines at 40 and yo are nealy one inch apart, and their kergth 11atinches: which length admits of great csactncis; for at the goth degree of latitude, the divilions are to quaters of a degree or 15 minutes. This accuracy of the divitions ad. mits of a peculiar advantage, namely, that is may be equally communicated to any length from 1 to 23 inches, by taking the parald! dilances (lee fig. 5.), viz. front 10 to 10,20 to 20,30 tu 30 , and io on as is done in like cafes on the lines of lines, tangents, \&a. Hence its univeral afe for dowing dials of any prepared fize. The line of hours for this end is adapted aud placed contiguous to it on the fector, and of a fice large enough for the very minutes to be dillinct on the part whore they are linalleth, which is on exch tide of the loour of III.

Firom the conftruction of the line of hours before fhown, the divifions on each fide of the hour III are the fame to each end, fo that the hom-line properly is only a doulde line of three hours. Hence a line of 3 houns anfisers all the purpofes of a line of $G$, by taking the double extent of 3 , which is the reafon why upon the fector the line of hours extends only to ${ }_{4}^{1}$.

To make ufe of the line of latitude and line of hours on the fectur: As fingle feales unly, they will be found more accurate than thofe placed on the common fales and fectors, in which the hoars ane ulually fubdivided, but into 5 minutes, and the line of latitudes into whole degrees. But it is dhown above how much more acenrately thefe lines are divided on the dialing fector. As an example of the great exactuels with Which horizontal and other dials may be drawn by it, on account of this new fiatoral difpolition of thefe feales, and how all the advantages of their great length are pre- Fig. wo ferved in any leffer length of the VI o'clock line ce $e$ and $a f:$ Apply either of the diftances of ce or af to the lime of latitude at the given latitude of London, fuppofe $51^{\circ} 32^{\prime}$ on one line to $51^{\circ} 32^{\prime}$ on the other, in the manner dhown in lig. 5 . and then taking all the hours, quarters, \&c. from the hour-feale by limilas parallel extents, you apply them upon the lines $c d$ and $f l$ as before deferibed.

As the hour-lines on the fector cxtend to but $4^{x}$, the elouble dijlanee of the howr 3, when ufed cithis fingly or fictorally, mult be taken, to be lirit applied from $51^{\circ} 32^{\prime}$ on the latitudes, to its contact on the XII o'elock line, before the feveral hours are laid off. The method of drawing a verical north or fouth dial is perfectly the fame as for the above horizontal onc; cnly reverfing the hours as in hig. I. and making the angle of the dlile's height equal to the complement of the latitude $3^{\circ} \quad 28^{\prime}$.
'The method of drawing a vertical declining dial by the fector, is almolt evident from what las becn already faid in dialing. But more fully to comprehend
the mater, it mut be confuered there will be a variation of particulars as follow: 1 . Of the fulylite or line over which the Itile is to be placed; 2. 'Tle height of :lue itile above the plane; 3. 'Ihe diflerence between the meridian of the place and that of the plane, or theis difference of longitude. From the given latitade of the flace, and checlination of the plane, yon calculate the thererequifies juft mentioned, as in the following exaimple. Let it be required to make an erio jouth diult, dechining from the meridian weftowed $28^{3}+3^{\prime}$. in the latitule of Lundon $51^{\text {² }} .32^{\prime}$. 'The firlt thing to be found is the diftance of the fubtila line $G B$ (tig. 3.) from the meridian of the plane GXII. 'The analugy from thin is: As radius is to the jine of the declination, fo is the co-tangent of the latitude to the tangent of the diffunco jouglit. viz. As radius : $28^{\prime}+3^{\prime}:$ : tang. $33^{\prime \prime} 23^{\prime}$ : tan gent $20^{\circ} 55^{\prime}$. 'This and the following analogy may be as accurately worked on the Gunter's line of fincs, tangents, sec. properly placed on the fector, as by the comnon way from logarithms. Next, To find the plane's diference of longitude. As the fine of the hatimde is to rature, fo is the tangent of the declinution to the tanysent of the difforche of longitule', viz. As s $51^{\circ} 32^{\prime}$ : radius : : tang. $28^{\circ}+3^{\prime}$ : tang. $35^{\circ} \mathrm{o}^{\prime}$. Laftly, to find the height of the thile: As ruthus is to the co-fine of the letiluste, fo is the co-fine of the teclination to the fine of the fille's breish, viz. Radius: s $39^{\circ} 23^{\circ}:: 561^{\circ} 17^{\prime}: 533^{\circ} 5^{\prime}$.

The thece requilites thus obtained, the dial is drawn in the following maner: Upon the moridian line $G$ XII, with any radius $G C$ defaibe the arch of a circle, upon which fit off $20^{\circ} 55^{\prime}$ from $C$ to $Z$, and draw GIS, which will be the fubllidar line, over which the tile of the dial mult be placed.

At right angles to this line $G B$, draw of 9 dade finitely through the point $G$ : then from the feale of latitudes take the height of the totie $3355^{\prime}$ and fet it each way from $G$ to $A$ and $\mathfrak{Q}$ Lailly, take the doubie length of 3 on the huus line in your compaffer, and fetting one froot in $A$ or $\mathcal{Q}^{2}$, with the other fout mark the line $G B$ in $D$, and join $A D \sum D$, and then the triangle $A D Q$ is completed upon the latfile $C D$.

To lay off the houre, the plane's difference of tongitude being $35^{\prime}$, equal to 2 h . 20 min . in time, allow ing $15^{\circ}$ to an hour, fo that there will be 2 h. $20^{\circ}$ betwecn the point $D$ and the meridian $G X 1 I$, in the line $A D$. 'Iherefore, take the firt 20 ' of the hourfale in your compaffes, and fet off from $D$ to 2 ; then take 1 h. $20^{\prime}$, and fet off from $D$ to r; 2 h. $20^{\prime}$, and fet off from $D$ to $12 ; 3$ h. 20 , from $D$ to $11 ; 4$ h. 20 from $D$ to 10 ; and 5 h .20 from $D$ to 9 , which will be 40 from $A$.

Then, on the other fide of the fubltilar line $G P$, you take for from the teginning of the feale, and fet off from $D$ to 3 ; then take a h. $40^{\prime}$, and fet off from $D$ to + ; alfo $2 l_{1}$. $0^{\prime}$, and fet off from $D$ to 5 ; and io on to 8 , which will be $20^{\prime}$ from 2 . Then from $G$ the centre, through the leveral points $2,1,12,11,10,9$, on one hide, and $3,4,5,6,7,8$, on the other, you draw the hour-lines, as in the figure they appear. The hour of VIII need only be drawn for the morning ; for the Eno sues uff from this wigl decliner $20^{\prime}$ before VIII in
the evening. - The quarters, \&c. are all fet off in the fame manner from the hour-feale as the above hours were.

The next thing is fixing the file or gnomon, which is always placed in the fabltiar line $G B$, and which is already draw. The thile above the plane has been found to be $33^{\circ} 5^{\prime}$ : therefore with any radius $G B$ deferibe an obfeure arch, upon which fet of $33^{\circ} 5^{\prime}$ from $B$ to $S$, and drawn $G S$, and the angle $S G B$ will be the true height of the gnomon above the lubHile $G B$.
11. the $D_{\text {thling }}$ Trigon is another new inttrament of great utility in the practice of dialing; and was alfo contrived by the late $\mathrm{Mr}_{1}$ Martin. It is compofed of two graduated feales and a plant one. On the feale $A B$ is graduated the line of latitudes; and on the fale $A C$, the line of hours: thefe properly conjuined with the plane feale $B D$, as fhown in the figure, traly repreient the gnomonical triangle, and is properly called a dialinis trigon. The hour-feale $A C$ is here of its full length; fo that the hours, halves, quarters, \&e. and every lingle minute (if required) anay be immediately fet off by a itecl point; and from what has befure been obferved in regand to the fector, it mutt appear that this method by the trigon is the molt expeditious way of drawing dials that any mechanifm of this fort can affod. As an exmple of the application of this trigon in the contruction of an horizontal dial for the latitude of London $513^{2}$, you mult pruceed as follows: Apply the trigon to the 6 o'cluck line af (lig. i.) on the mornings fide, fo that the line of hatitudes may coincide with the 6 o'duck line, and the begiming of the divilions conede with the centre $a$; and at 51032 of the line of latitudes place tioe 6 veluek edge of the line of hours, and the other end or beginning of the feale clofe asamit the phane feale $i d$, as by the figure at $d$; and fallening thefe bars down by the feveral pins placed in them to the paper and board, then the hours, quarters, ixe are all marked off with a fecel point initanty, and the hon-liaes drawn throurin them es before, and as thesw in the figure. When this is done for the lade a $f$ or moming hours, you mere. the leale of latitudes and hours to the other hide o $e$, or afternoon fide, and place the hour-fcale to $51^{\circ} 3 z^{\prime}$ as before, and puth down the hours, quarters, \&xc. and draw the lines through them for the afternoun hours, which is clearly reprefented in the figure.

La like manaer is an crea nortb or fouth dial dawn (fee fig 2.), the operation being jutt the fame, only reverling the hous as in the figure, and marking the angles of the thile's height equal to the complement of the latitude.

This trigon may be likewifo ufed for drawing vertical dedinting diuds (fig. 3), as it is with the fame lacility apaled to the lines $A D, G B$, and the hours and quatens marked off as before directed.

Mr Jones graduates on the fiale $B D$ of the trio gon a hane of chords, which is found ufeful for laying off the necuflary angles of the thile's height. The fales of this triron, when'not in ufe, lie very clofe together, and yack "n itote a portable cafe for the pocket.

Dialing Diaziva Lines, or Scales, are graduated lines, plati) ced on rules, or the edges of quadrantes, and ouher inDialosue. Arments, to expedite the conitruction of dial. Sce Plate CLVIII.

Dishing.Sidor. Sce Dialing, p. 803, and Plate CLXI.

Dheiling-Sphore, is an indtrument made of brafs, with feveral femicireles diding over wae another, on a moving horizon, to demundrate the nature of the doetrine of fpherical triangles, and to give a true idea of the drawing of dials on all manner of plames.

Diming-Tijon. See Dialing, p. Sot, and Piate CLXI.

Dialing, in a mine, called alfo Phaming, is the ufing of a compafs (which they coll dial), and a long line, to know which way the load or vein of ore inclines, or where to thitt an air-fhaft, or oring an adit to a defired place.

DRALHS, in antiquity, a Latin term fignifying fomething that belongs to Jupitu. - The word is fomed from $\Delta 0^{\circ}$, the genitive of as. Fapiter.

DAAIITHA, in the writings of the ancients, a word ufed to experf due devent omaments of the Greeks and Romans, compokd of goid and gems. "Ihey alfo called thele lithocoita, "cemented thows or gems;" the gole being in this cane as a cement to hold the flones together. Ithey wore tracelets and other ornamental things about thicir habits thus made; and their cups and table-fumiture, for magnificent treats, were of this kind. The green itenes were found to fuceed bed of all in the things ; and the emerdd and rretuh topaz, or, as we call it, dryfolite, were wolt in eftem for thio purpofe. This ufe of the homes explans what Pliny vere offen fays of them in his de. feription: Nibil jarnalius aurum ilaca, "Nothing becomes gold better:" this he fay of the greentopaz of chryfolite; and this and many vother like pallages have greatly perplexed the eritice, who did not hit upont this explication.

DlaLLiNG, or Dialing. See Dialing.
DIALOGISM, in rlitoric, is ulat for the foilonquy of perfors delibuating with thendelecs. See Sohavely.

DIALOGUE, inmatters of literatare, a converation between two or more pertions either by writing or by word of momil.

Comptition and sitie of written $D_{\text {rivocuthe. }}$ As the end of ipech is converfation, no kind of writing can be more naturd than dialorrue, which reprefents this. And aceodingly :ve nind it was introduced very early, for there are feveral instances of it in the Mofaic hi:Ansy. The ancient Grecte writers allo fell very mach inco it, efuecially the phitofophers, as the molt convenient and agreable mothod of communicating their fentimerts and inttructions to manaind. And indeed it feems to be attended with sery conderable advantages, if well and judicionlly mavaged. For it is capable to make the dridl fubjects entertaining and fleaGant, by its varicty, and the differnt characters of the fyeakers. lieflike, things may be canvalfud more ininutdy, and many lifler maters, which ferve to clear up a lubject, may be introduced with a better giace, by queltions and anfwers, objections and replies, than can be convenimity don in a continad diformate.

There is hisenife a further abratage in this way of Dafazue. writing, that the athor is at liberty to choofe his ipeakers: And therefore, as Cicero has well obforve?, whan we imagine that we hear perions of an cttahbithed Peputation hor wiflom and krowledge talking together, it necolfarily adds a weghe and ambority to the difo courfe, and more clubly energges the attention. "Ihe tubject-mater of it is very intentive: for whatever is a nroper aryunent of "hfourle, public or private, ferious or jocole; whatever is fit for wife and ingeniuns men to tatk upon, either for improvement of divertion; is fuitabie for a dialugue.

From this general accoust of the nature of dialogue, it is caly to pereeive what hind of ayle beft fuis it. Its affinity with Episteses, Gowsthere ought to be no great difference between them in this refpect. Indeed, fome have been of opinion, that it ought rather to link bclow that of an epille, becanfe dialogues thould in all relpeets reprefent the freedon of converfation; whereas epittles ought fometimes to be compofed with care and accuracy, efpecially when writen to fuperiors. But there feem; to be little weight in this argument, fince the delign of an epitle is to fay the fame things, and in the fame manore, as the writer judges would be moll fit and proper for him to $\{p e a k$, if prefent. And the very fame thing is celigned in a dialogre, with refpect to the leveral perfons concemed in it. Upon the whole, thercfore, the like plain, eafy, and dimple ttite, fuited to the nature of the fubject, and the particular characters of the perfons concuned, feems to agrice to buth.
 than lettera, we thall give a note particular account of the princiral things neceffary to be regarded in their comporiturs, and illultrate them chiefly from Cicero's excellent Dialorges concerning an Orator.-A dia. logne, then, conditis of two parts; an intruchanu, an I the baty of the difulergi.

1. 'The introdhation acquants us with the place, time, pulons, and uccafon, of the consafation. 'Ihms (ia cero places the fetne of his dialogucs at Craffus's courbtiy feat; a very proper recess, both for fich a debate and the parties chrgaged in it. And as they were pe:fons of the dont rank, and cmployed in the greated affaiss of hate, and the difcourfe held them for two datys; for repreferts it. to bave happened at the time of a foltival, whes there was no butmers done at kome, which gave them an opportunity to bo abfent.

And becanice the greatela regiard is to be had in the chevice of the jerfons, who ought to be fich as are well acquainted with the fubject upon which they difcourfe; in the fe dialognes of Cicero, the two principal difputants are Cadius and Antony, the greatelt crators of that age, and therefore the moft proper perfons to difpue upon the (fuslifications necefary for their art. One would think it fearee necedtary to wheree, that the conference thould be held by perfous who lived at the fame time, and fu vere capable to convorf: together. Put yet fonse goed writers have man into the impropriety of feigning diadognes beturen peatons who lived at diftant times. Plato tosk this macthod, in
 who hatre been willing to bing pertont to difcumfe

## D I A

niangrue. has made himfelf moft remarkabie in this way. As to the number of perfons in a dialogue, they may be more or lefs: fo many as can conveniently carry on a converfation without diforder or confulion may be admitted. Some of Cicero's dialognes have only two, others three or more, and thofe concerning an orator feven. And it is convenient they fould all, in fome refpects, be perfons of different characters and abilities; which contributes both to the variety and beauty of the difcourfe, like the diferent attitude of figures in a picture. Thus, in Cicero's dialogues latt mentioned, Craflus excelled in art, Antony primipally for the force of his genius, Catullus for the purity of his ftile, Scevola for his fkill in the law, Cxfar for wit and humour; and though Sulpitius and Cotta, who were youag men, were both excellent orators, yet they differed in their manner. But there huold be always one chief perfon, who is to have the main part of the converfation; like the hero in an epic poem or a tragedy, who excels the relt in action; or the principal tigure in a pieture, which is moft conficicuous. In Plato's dialogres, this is Socrates; and Crafius, in thofe of Cicero above mentioned.

It is ufual, likewife, in the introdaction, to acquaint us with the occalion of the difcourfe. Indeed this is not always mentioned; as in Cicero's dialogue of the parts of oratory, where the fon begins immediately with dafiring his father to inftruct him in the art. But it is generally taken notice of, and molt commonly reprefented, as accidental. The realon of which may be, that fuch difeourfes appear molt natural; and may likewife afford fome kiill of apology for the writer in managing his different characters, fince the greateft men may be fuppofed not always to fpcak with the utnot exactnefs in an accidental converfation. Thus Cicero, in his dialogues concerning an orator, makes Craffus occafionally fall upon the fubject of oratory, to divert the company from the melancholy thoughts of what they had been difconring of before, with relation to the public diforders, and the dangers which threatened their country. But the introduction ought not to be tno long and tedious. Mr Addifon ecmplains of this fault in fome authors of this kind. "For though (as he fays) fome of the finett treatifes of the moft polite Latin and Greek writers are in dialogue, as many very valuable pieces of French, Italian, and Englifh, appear in the fame drefs; yet in fome of them there is fo much time taken up in ceremony, that, before they enter on their fubject, the dialogue is half over."
2. We come now to the bocly of the difcourfe, in which fome things relating to the perfons, and others to the fubject, are proper to be remarked.
And as to the perfons, the principal thing to be attended to is to heep up a juftnefs of character through the whole. And the dillinet characters ought to be fo perfectly obicrved, that from the very words themfelves it may be always known who is the fpeaker. This makes dialogne more difficult than fingle defreiption, by reafon of the number and variety of characters which are to be drawn at the fame time, and each of them managed with the greateft propriety. The principal fpeaker fhould appear to be a perfon of great fenfe and wifdom, and bett acquainted with the fubjeet. No queftion ought to be alked him, or objection
flarted to what he fays, but what he fhould fainly an. Diatogue. fwer. And what is faid by the rell ihould principally tend to promote his difcourfe, and carry it through in the molt artful and agreeable manner. Where the argument is attended with difficulties, one other perfon or more may beintroduced, of equal reputation, or near it, but of different fentiments, to oppofe him and maintain the contrary lide of the quettion. This gives opportunity for a thorough examination of the point on both tides, and anlweriug all objections. But if the combatants are not pretty equally matched, and maAters of the fubject, they wall treat it but fuperficially. And through the whole debate there ought not to $b=$ the leaft wrangling, peevithnefs, or obltinacy; nothing but the appearance of good-humour and good breeding, the gentlicman and the friend, with a readinefs to fubmit to conviction and the force of truth, as the evidence thall appear on one fide or the other. In Cicero, thefe two characters are Craffus and Antony. And from them Mr Addifon feems to have taken his Philander and Cynthio, in his Diaiogues upon the ufofitness of anciert medals, which are formed pretty much on Cicero's plan. Where younger perlons are prefent, or fuch who are not equally acquainted with the fubject, they goould be rather upon the inquiry than difpute: And the quettions they ath fhould be neither too long nor too frequent; that they may not too much interrupt the debate, or appear over talkative before wifer and more experienced perfons. Sulpitius and Cotta fuftain this character in Cicero, and Eugenius in Mr Addifon. And it is very convenient there fhould be one perfon of a witty and jocofe humour, to enliven the difcourfe at proper feafons, and make it the more entertaining, efpecially when the dialogue is drawn out to any confiderable length. Cefar has this part in Cicero. And in Mr Additon, Cynthio is a perfon of this turn, and oppole's Philander in a merry way. Mr Addifon's fuisject admitted of this: but the ferioufnefs and gravity of Cicero's argument required a different peaker for the jocofe part. Many perfons ought not to fpeak immediately one after another. Horace's rule for plays is :

> To crowd the face is odious and abfurd.
> let no fourth actor ftrive to fpeak a word.

Though Scaliger and others think a fourth perfon may fonetimes be permitted to fpeak in the fame feene without coufufion. However, if this is not commonly to be allowed upon the thage, where the actors are prefent, and may be diftinguifhed by their voice and habit; much lefs in a dialogue, where you have only their names to diftinguifh them.

With regard to the fubject, all the arguments fhould appear probable at leafl, and nothing be adranced which may feem weak or trivial. There ought alfo to be an union in dialogue, that the difcourfe may not ramble, but keep up to the main defign. Indeed, fhort and pleafant progreffions are fometimes allowable for the eafe and entertainment of the reader. But every thing thould be fo managed, that he may ftill be able to carry on the thread of the difcourfe in his mind, and keep the main argument in view, till the whole is finifhed. The writers of dialogue have not confined their difcourfes to any eertain fpace of time; but either concluded them with the day, or broke off when their fpeakers have been tired, and reaffumed them again the next day. Thus Cicero allows two days for

Dialogue his three dialogues concerning an orator; but Mr Ad! difon estends his to three days, allowing a day for each. Nor has the fume method always bea obleverd
in compofing dialograce. For fornctiones the vriter, hy way of natratie, relutes a difoon fe which pafied between other perfons. Such are the dialngres of Ci . cero and Mr Addifon laft mentioned, and many athers both of the ancients ant moderns. But, at other times, the feakers are introduced in perfon, as talking to each other. "llhis, di Cicero obleres, prevents the frequent repetioion of thofe words, be faid, and be replices; and lemplucing the heanco, as it were, in the converfation, giw. him a more lively reprefentation of the difcourfe, which makes it the more affecting. Aut therefore Cicero, who wrote his diulogue of old age in this manner, in which Cato, who was then in jears, largely recouns the fat isfactions of life which maty be cnjoyed in old age, tells his firend Atticus, he was himifilf fo affected with that difeounfe, that when he reviewcel it fonetimes, he fancied they were not his own words, but Cato's. There are fome other dialorgues of Cicero, written in the fame way; as that Of friond/hip, and Of the parts of oratory. And both llato and Lueian generally chofe this method.

Dialogef, in dramatic compofition. See Poetry, chap. ii 22, 23 .

DIALTHAEA, in pharmacy, an unguent much ufed as a refolvent; fo called from Altheta, or marh. mallows, which is the principal ingredient in it.

DIALUM, in botany: A genus of the monogr. aia order, belonging to the diandria clafs of plants. The eorolla is pentapetalous; no calyx ; the dtamina at the upper fide of the reeeptacle.

DIALYSIS, in grammar, a mark or chanacter, confliting of two points, $\cdot$, placed over two vowels of a word, in order to Feparate them, becaufe otherwife they would make them a diphthong, as Mofiac, Eic.

DIAMASTIGOSIS, a fetival at Sparta in honour of Diana Orthia, which received that name arotou सxarow, from whisfing, becaule boys were whipped be-
fure the alta of ile groddefs. Thefe looys, calleil Bo. Diamaft. monica, were originally fice born Spartans, but in the more delicatc ages they were of nom birth, and gencrally of a havilh origin. This operation was pertornncd by an offeer in a fevere and unfeching maner; in that no compalion fhould be raifed, the priet thend noar the altar with a fmall highe latue of the goddedo, which fuddeny beeame heary and infupportable if the lah of the whip was more lebient or lefs rigoruns. The parents of the children attendel the fulannity, and estorted then not to commit any thing cither liy fear or groans, that might law unworthy of Laconian cdacation. Thed flagethations were fos torere, that the blood ginlied in profufe torrents, and many expirud under the lath of the whip, without nttering a grom, or leetraying any marks of fear. Such a death was reekoned very honourable; and the corpfe was buricd with much folemnity with a garland of flowers on its head. The origin of this feltimal is unknown. Some fuppofe that Lycurgus firt inflituted it to inure the youth of Laedemon to bear labour and fatigue, and render them infenfible to pain and wounds. Others maintain, that it is a mitisation of an oracle, which orclered that human blood thould be fhed on Diana's altar; and according to their opinion, Oreftes firft introduced that barbarous cuftom, after he had brought. the flatue of Diana Taurica into Greeee. There is another tradition which mentions that Paufanias, as lie was offering prayers and faerifices to the gods, before he engaged witb Mardonius, was fuddenly attacked by a number of Lydians who difturbed the facrifice, and were at lalt repelled with ftaves and Itones, the only weapons with which the Lacedemonians were provided at that moment. In commemoration of this ${ }_{3}$. therefore, that whippiug of hoys was infituted at Sparta, and after that the Lydian procedfon.

DIAME'TER, in geometry, a right line pafing thro' the centre of a circle, and terminated at tach ficu: by the circumfernace thereof. See Geomitar.

[^21]:    of the Britifh feas. It is about fonn inches in length; the flin without fales, flippery, and of a duky colour. It hath alfo an apparatus for adhering to fones and rocks limilist to the others.
    CYDER, or Ciner, an excultent drink made of the juice of apples, efpecially of the more curions table kinds; the juice of thefe being eftecned nore cardini and plealant than that of the wild or haff kinds. In and plealant than that of the wild or harfin kinds. In
    making this drink it hath lomg been thought necefary, in every part of England, to lay the harder cyderfruits in heaps for fome cime before breaking their pulps; bat the Devonthire people lave much improved this practice. In other counties the method is to make thete heaps of apples in a houfe, or mader fome
    covering inclofed on every fide. This method hath make thete heaps of apples in a houfe, or under fome
    covering inclofed on every fide. This method hath been found defective, becaufe, by excluding the free air, the heat foon became too violent, and a great perpiration enfued, by which in a thort time the peripration enfucd, by which in a fort time the
    luls of juices was lo great, as to reduce the fruit to lalf their former weight, attended with a general rot. tennels, rancid finell, and difagreeable tatte. In the
    Sonth-hans, a midde way has been purfued, to avoid tennels, rancid minelf, and difagreeable tatte. In the
    Sonth-hams, a midde way has been purfued, to avoid the inconveniences and lofs attending the above. I'hey make their heaps of aples in an open prat of an or-
    chard, where, by the means of a free air and lefs permake ther heaps of ajples in an open part of an or-
    chard, where, by the means of a free air and lefs perfpiration, the delined maturity is brought about, with an inconforeratle wate of the juices and decay of the frotit, entirely frer of ranknefs ; and though fome apfroit, entircly free of ranknefs; and though fome ap-
    ples ert even in this manner, they are very few, and are thill fit for ufe; all continue phanp and fall of juices, and very much heighten the colour of eyders,
    without ill tafe or fmell. whoth ill tafte or fmell.

    In purfuing the Devouthire method, it is to be obfersed, 1. 'That all the promifucous kinfs of applea that have dropted from the trees, from time to time, are to be gathored up and laid in a heap by themCelves, arm to be made into cyder after having for lain aboet ten days. 2. Such apples as are gathered from the tres, having alrcady acquired fome degree of maturity, are like wife to be laid in a beap by themfelses for aburt a fortnight. .3. The later hard truits, which are tor be left 0y the trees till the approath of froth in appretended, are to be laid in a foparate heap, whet a they are to remain a month or lix weeks, by which, notwiththanding rolk, rain, S.c. their juices will reeve lich a matasation, as will prepare them tor a kimdy fermentaion, and which they comid not have attaived on the trees by means of tiee colduefs of the feathin.

    It is ohfervatle, that the riper and mellower the有
